## 7.36.9 Electrical specification

### 7.36.9.1 TWIM interface electrical specifications

| Symbol           | Description                                            | Min. | Typ. | Max. | Units   |
|------------------|--------------------------------------------------------|------|------|------|---------|
| $f_{TWIM,SCL}$   | Bit rates for TWIM <sup>32</sup>                       | 100  |      | 1000 | kbps    |
| $t_{TWIM,START}$ | Time from STARTRX/STARTTX task to transmission started |      | 1.5  |      | $\mu$ s |

### 7.36.9.2 Two Wire Interface Master (TWIM) timing specifications

| Symbol                       | Description                                                              | Min. | Typ. | Max. | Units |
|------------------------------|--------------------------------------------------------------------------|------|------|------|-------|
| $t_{TWIM,SU\_DATI}$          | Input data setup time before positive edge on SCL – all modes            | 20   |      |      | ns    |
| $t_{TWIM,HD\_DATI}$          | Input data hold time after negative edge on SCL – 100, 250 and 400 kbps  | 0    |      |      | ns    |
| $t_{TWIM,HD\_DATO}$          | Output data hold time after negative edge on SCL – 100, 250 and 400 kbps | 500  |      | 625  | ns    |
| $t_{TWIM,HD\_DATO,1000kbps}$ | Output data hold time after negative edge on SCL – 1000 kbps             | 250  |      | 315  | ns    |
| $t_{TWIM,HD\_STA,100kbps}$   | TWIM master hold time for START and repeated START condition, 100 kbps   | 9900 |      |      | ns    |
| $t_{TWIM,HD\_STA,250kbps}$   | TWIM master hold time for START and repeated START condition, 250 kbps   | 3900 |      |      | ns    |
| $t_{TWIM,HD\_STA,400kbps}$   | TWIM master hold time for START and repeated START condition, 400 kbps   | 2400 |      |      | ns    |
| $t_{TWIM,HD\_STA,1000kbps}$  | TWIM master hold time for START and repeated START condition, 1000 kbps  | 900  |      |      | ns    |
| $t_{TWIM,SU\_STO,100kbps}$   | TWIM master setup time from SCL high to STOP condition, 100 kbps         | 5000 |      |      | ns    |
| $t_{TWIM,SU\_STO,250kbps}$   | TWIM master setup time from SCL high to STOP condition, 250 kbps         | 2000 |      |      | ns    |
| $t_{TWIM,SU\_STO,400kbps}$   | TWIM master setup time from SCL high to STOP condition, 400 kbps         | 1250 |      |      | ns    |
| $t_{TWIM,SU\_STO,1000kbps}$  | TWIM master setup time from SCL high to STOP condition, 1000 kbps        | 500  |      |      | ns    |
| $t_{TWIM,BUF,100kbps}$       | TWIM master bus free time between STOP and START conditions, 100 kbps    | 5250 |      |      | ns    |
| $t_{TWIM,BUF,250kbps}$       | TWIM master bus free time between STOP and START conditions, 250 kbps    | 2250 |      |      | ns    |
| $t_{TWIM,BUF,400kbps}$       | TWIM master bus free time between STOP and START conditions, 400 kbps    | 1500 |      |      | ns    |
| $t_{TWIM,BUF,1000kbps}$      | TWIM master bus free time between STOP and START conditions, 1000 kbps   | 750  |      |      | ns    |

Figure 226: TWIM timing diagram, 1 byte transaction

<sup>32</sup> High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see [GPIO — General purpose input/output](#) on page 293 for more details.

### 7.36.10 Pullup resistor

Figure 227: Recommended TWIM pullup value vs. line capacitance

- The I<sup>2</sup>C specification allows a line capacitance of 400 pF at most.
- The value of internal pullup resistor ( $R_{PU}$ ) for nRF5340 can be found in [GPIO — General purpose input/output](#) on page 293.

## 7.37 TWIS — I<sup>2</sup>C compatible two-wire interface slave with EasyDMA

TWI slave with EasyDMA (TWIS) is a two-wire half-duplex slave which can communicate with a master device connected to the same bus.

Listed here are the main features for TWIS:

- I<sup>2</sup>C compatible
- Supported baud rates: 100 and 400 kbps
- EasyDMA

Figure 228: TWI slave with EasyDMA

A typical TWI setup consists of one master and one or more slaves. For an example, see the following figure. TWIS is only able to operate with a single master on the TWI bus.

Figure 229: A typical TWI setup comprising one master and three slaves

The following figure shows the TWI slave state machine.

Figure 230: TWI slave state machine

The following table contains descriptions of the symbols used in the state machine.

| Symbol            | Type         | Description                                                                                                                    |
|-------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| ENABLE            | Register     | The TWI slave has been enabled via the <a href="#">ENABLE</a> register.                                                        |
| PREPARETX         | Task         | The <a href="#">TASKS_PREPARETX</a> task has been triggered.                                                                   |
| STOP              | Task         | The <a href="#">TASKS_STOP</a> task has been triggered.                                                                        |
| PREPARERX         | Task         | The <a href="#">TASKS_PREPARERX</a> task has been triggered.                                                                   |
| STOPPED           | Event        | The <a href="#">EVENTS_STOPPED</a> event was generated.                                                                        |
| RXSTARTED         | Event        | The <a href="#">EVENTS_RXSTARTED</a> event was generated.                                                                      |
| TXSTARTED         | Event        | The <a href="#">EVENTS_TXSTARTED</a> event was generated.                                                                      |
| TX prepared       | Internal     | Internal flag indicating that a <a href="#">TASKS_PREPARETX</a> task has been triggered. This flag is not visible to the user. |
| RX prepared       | Internal     | Internal flag indicating that a <a href="#">TASKS_PREPARERX</a> task has been triggered. This flag is not visible to the user. |
| Unprepare TX      | Internal     | Clears the internal 'TX prepared' flag until next <a href="#">TASKS_PREPARETX</a> task.                                        |
| Unprepare RX      | Internal     | Clears the internal 'RX prepared' flag until next <a href="#">TASKS_PREPARERX</a> task.                                        |
| Stop condition    | TWI protocol | A TWI stop condition was detected.                                                                                             |
| Restart condition | TWI protocol | A TWI restart condition was detected.                                                                                          |

Table 77: TWI slave state machine symbols

TWIS can perform clock stretching, with the premise that the master is able to support it.

It operates in a low power mode while waiting for a TWI master to initiate a transfer. As long as TWIS is not addressed, it will remain in this low power mode.

To secure correct behavior of the TWI slave, PSEL.SCL, PSEL.SDA, CONFIG, and the ADDRESS[n] registers must be configured prior to enabling the TWI slave through the ENABLE register. Similarly, changing these settings must be performed while the TWI slave is disabled. Failing to do so may result in unpredictable behavior.

### 7.37.1 Shared resources

TWIS shares registers and other resources with other peripherals that have the same ID as TWIS.

Therefore, you must disable all peripherals that have the same ID as the TWI slave before TWIS can be configured and used. Disabling a peripheral that has the same ID as the TWI slave will not reset any of the registers that are shared with TWIS. It is therefore important to configure all relevant registers explicitly to secure that TWIS operates correctly.

The Instantiation table in [Peripherals](#) on page 149 shows which peripherals have the same ID as TWIS.

### 7.37.2 EasyDMA

TWIS implements EasyDMA for accessing RAM without CPU involvement.

The following table shows the Easy DMA channels that TWIS implements.

| Channel | Type   | Register Cluster    |
|---------|--------|---------------------|
| TXD     | READER | <a href="#">TXD</a> |
| RXD     | WRITER | <a href="#">RXD</a> |

Table 78: TWIS EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 153.

The STOPPED event indicates that EasyDMA has finished accessing the buffer in RAM.

### 7.37.3 TWIS responding to a read command

Before TWIS can respond to a read command, it must be configured correctly and enabled via the ENABLE register. When enabled, TWIS will be in its IDLE state.

A read command is started when the TWI master generates a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE=0, READ=1). The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) response from the TWI slave.

TWIS is able to listen for up to two addresses at the same time. This is configured in the ADDRESS registers and the CONFIG register.

TWIS will only acknowledge (ACK) the read command if the address presented by the master matches one of the addresses the slave is configured to listen for. TWIS will generate a READ event when it acknowledges the read command.

TWIS is only able to detect a read command from the IDLE state.

TWIS will set an internal 'TX prepared' flag when the PREPARETX task is triggered.

When the read command is received, TWIS will enter the TX state if the internal 'TX prepared' flag is set.

If the internal 'TX prepared' flag is not set when the read command is received, TWIS will stretch the master's clock until the PREPARETX task is triggered and the internal 'TX prepared' flag is set.

TWIS will generate the TXSTARTED event and clear the 'TX prepared' flag ('unprepare TX') when it enters the TX state. In this state TWIS will send the data bytes found in the transmit buffer to the master using the master's clock.

TWIS will go back to the IDLE state if the TWI slave receives a restart command when it is in the TX state.

TWIS is stopped when it receives the stop condition from the TWI master. A STOPPED event will be generated when the transaction has stopped. TWIS will clear the 'TX prepared' flag ('unprepare TX') and go back to the IDLE state when it has stopped.

The transmit buffer is located in RAM at the address specified in the TXD.PTR register. TWIS will only be able to send TXD.MAXCNT bytes from the transmit buffer for each transaction. If the TWI master forces the slave to send more than TXD.MAXCNT bytes, the slave will send the byte specified in the ORC register to the master instead. If this happens, an ERROR event will be generated.

The EasyDMA configuration registers RXD.PTR, TXD.PTR, RXD.AMOUNT, and TXD.AMOUNT, are latched when the TXSTARTED event is generated.

TWIS can be forced to stop by triggering the STOP task. A STOPPED event will be generated when TWIS has stopped. TWIS will clear the 'TX prepared' flag and go back to the IDLE state when it has stopped, see also [Terminating an ongoing TWI transaction](#) on page 718.

Each byte sent from the slave will be followed by an ACK/NACK bit sent from the master. The TWI master will generate a NACK following the last byte that it wants to receive to tell the slave to release the bus so that the TWI master can generate the stop condition. The TXD.AMOUNT register can be queried after a transaction to see how many bytes were sent.

A typical TWIS read command response is illustrated in the following figure, including clock stretching following a SUSPEND task.

Figure 231: TWIS responding to a read command

### 7.37.4 TWIS responding to a write command

Before TWIS can respond to a write command, TWIS must be configured correctly and enabled via the ENABLE register. When enabled, TWIS will be in its IDLE state.

A write command is started when the TWI master generates a start condition on the TWI bus, followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE=0, READ=1). The READ/WRITE bit is followed by an ACK/NACK bit (ACK=0 or NACK=1) response from the slave.

TWIS is able to listen for up to two addresses at the same time. This is configured in the ADDRESS registers and the CONFIG register.

TWIS will only acknowledge (ACK) the write command if the address presented by the master matches one of the addresses the slave is configured to listen for. TWIS will generate a WRITE event if it acknowledges the write command.

TWIS is only able to detect a write command from the IDLE state.

TWIS will set an internal 'RX prepared' flag when the PREPARERX task is triggered.

When the write command is received, TWIS will enter the RX state if the internal 'RX prepared' flag is set.

If the internal 'RX prepared' flag is not set when the write command is received, TWIS will stretch the master's clock until the PREPARERX task is triggered and the internal 'RX prepared' flag is set.

TWIS will generate the RXSTARTED event and clear the internal 'RX prepared' flag ('unprepare RX') when it enters the RX state. In this state, TWIS will be able to receive the bytes sent by the TWI master.

TWIS will go back to the IDLE state if TWIS receives a restart command when it is in the RX state.

TWIS is stopped when it receives the stop condition from the TWI master. A STOPPED event will be generated when the transaction has stopped. TWIS will clear the internal 'RX prepared' flag ('unprepare RX') and go back to the IDLE state when it has stopped.

The receive buffer is located in RAM at the address specified in the RXD.PTR register. TWIS will only be able to receive as many bytes as specified in the RXD.MAXCNT register. If the TWI master tries to send more bytes to the slave than it can receive, the extra bytes are discarded and NACKed by the slave. If this happens, an ERROR event will be generated.

The EasyDMA configuration registers, see RXD.PTR etc., are latched when the RXSTARTED event is generated.

TWIS can be forced to stop by triggering the STOP task. A STOPPED event will be generated when TWIS has stopped. TWIS will clear the internal 'RX prepared' flag and go back to the IDLE state when it has stopped, see also [Terminating an ongoing TWI transaction](#) on page 718.

TWIS will generate an ACK after every byte received from the master. The RXD.AMOUNT register can be queried after a transaction to see how many bytes were received.

A typical TWIS write command response is illustrated in the following figure, including clock stretching following a SUSPEND task.

Figure 232: TWIS responding to a write command

### 7.37.5 Master repeated start sequence

An example of a repeated start sequence is one in which the TWI master writes two bytes to TWIS followed by reading four bytes from the slave.

This is illustrated in the following figure.

In this example, the receiver does not know what the master wants to read in advance. This information is in the first two received bytes of the write in the repeated start sequence. To guarantee that the CPU is able to process the received data before TWIS starts to reply to the read command, the SUSPEND task is triggered via a shortcut from the READ event generated when the read command is received. When the CPU has processed the incoming data and prepared the correct data response, the CPU will resume the transaction by triggering the RESUME task.

Figure 233: Repeated start sequence

### 7.37.6 Terminating an ongoing TWI transaction

In some situations, e.g. if the external TWI master is not responding correctly, it may be required to terminate an ongoing transaction.

This can be achieved by triggering the STOP task. In this situation, a STOPPED event will be generated when the TWI has stopped independent of whether or not a STOP condition has been generated on the TWI bus. The TWI slave will release the bus when it has stopped and go back to its IDLE state.

### 7.37.7 Low power

To ensure lowest possible power consumption when the peripheral is not needed stop and disable TWIS.

The STOP task may not be always needed (the peripheral might already be stopped), but if the task is triggered, software shall wait until the STOPPED event is generated before disabling the peripheral through the ENABLE register.

### 7.37.8 Slave mode pin configuration

The SCL and SDA signals are mapped to physical pins using the PSEL.SCL and PSEL.SDA registers.

The PSEL.SCL and PSEL.SDA registers and their configurations are only used as long as TWIS is enabled, and retained only as long as the device is in System ON mode. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register. PSEL.SCL and PSEL.SDA must only be configured when TWIS is disabled.

To secure correct signal levels on the pins used by TWIS while in System OFF mode, and when TWIS is disabled, these pins must be configured in the GPIO peripheral as described in the following table.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| TWI slave signal | TWI slave pin            | Direction | Output value   | Drive strength |
|------------------|--------------------------|-----------|----------------|----------------|
| SCL              | As specified in PSEL.SCL | Input     | Not applicable | S0D1           |
| SDA              | As specified in PSEL.SDA | Input     | Not applicable | S0D1           |

Table 79: GPIO configuration before enabling peripheral

### 7.37.9 Registers

#### Instances

| Instance   | Domain      | Base address | TrustZone |     |     | Split access | Description                |

   See the memory chapter for details about which memories are available for EasyDMA.

### 7.37.9.33.2 TXD.MAXCNT

Address offset: 0x548

Maximum number of bytes in TXD buffer

## 7.37.10 Electrical specification

### 7.37.10.1 TWIS slave timing specifications

| Symbol                            | Description                                                                 | Min. | Typ. | Max. | Units         |
|-----------------------------------|-----------------------------------------------------------------------------|------|------|------|---------------|
| $f_{\text{TWIS,SCL}}$             | Bit rates for TWIS <sup>33</sup>                                            | 100  |      | 400  | kbps          |
| $t_{\text{TWIS,START}}$           | Time from PREPARERX/PREPARETX task to ready to receive/transmit             |      | 1.5  |      | $\mu\text{s}$ |
| $t_{\text{TWIS,SU\_DAT}}$         | Input data setup time before positive edge on SCL – all modes               | 20   |      |      | ns            |
| $t_{\text{TWIS,HD\_DAT}}$         | Input data hold time after negative edge on SCL – all modes                 | 0    |      |      | ns            |
| $t_{\text{TWIS,HD\_DATO}}$        | Output data hold time after negative edge on SCL – all modes                | 350  |      | 600  | ns            |
| $t_{\text{TWIS,HD\_STA,100kbps}}$ | TWI slave hold time from for START condition (SDA low to SCL low), 100 kbps | 500  |      |      | ns            |
| $t_{\text{TWIS,HD\_STA,400kbps}}$ | TWI slave hold time from for START condition (SDA low to SCL low), 400 kbps | 500  |      |      | ns            |
| $t_{\text{TWIS,SU\_STO,100kbps}}$ | TWI slave setup time from SCL high to STOP condition, 100 kbps              | 500  |      |      | ns            |
| $t_{\text{TWIS,SU\_STO,400kbps}}$ | TWI slave setup time from SCL high to STOP condition, 400 kbps              | 500  |      |      | ns            |
| $t_{\text{TWIS,BUF,100kbps}}$     | TWI slave bus free time between STOP and START conditions, 100 kbps         | 500  |      |      | ns            |
| $t_{\text{TWIS,BUF,400kbps}}$     | TWI slave bus free time between STOP and START conditions, 400 kbps         | 500  |      |      | ns            |

Figure 234: TWIS timing diagram, 1 byte transaction

## 7.38 UARTE — Universal asynchronous receiver/transmitter with EasyDMA

The Universal asynchronous receiver/transmitter with EasyDMA (UARTE) offers fast, full-duplex, asynchronous serial communication. Built-in flow control (CTS, RTS) is supported in hardware at a rate up to 1 Mbps and EasyDMA data transfer to and from RAM.

The main features of UARTE are the following:

- Full-duplex operation
- Automatic hardware flow control
- Optional even parity bit checking and generation
- EasyDMA
- Up to 1 Mbps baudrate
- Return to IDLE between transactions supported (when using HW flow control)

<sup>33</sup> High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see [GPIO](#) chapter for more details.

- One or two stop bit
- Least significant bit (LSB) first

Figure 235: UARTe configuration

The GPIOs used for each UART interface can be chosen from any GPIO on the device and are independently configurable. This enables device pinout flexibility and efficient use of board space and signal routing.

**Note:** The external crystal oscillator must be enabled to obtain sufficient clock accuracy for stable communication. See [CLOCK — Clock control](#) on page 72 for more information.

### 7.38.1 EasyDMA

UARTe implements EasyDMA for reading and writing to and from the RAM.

If the TXD.PTR and the RXD.PTR are not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions.

The RXD.PTR, TXD.PTR, RXD.MAXCNT, and TXD.MAXCNT registers are double-buffered. They can be updated and prepared for the next reception or transmission immediately after having received the RXSTARTED or TXSTARTED event.

The ENDRX and ENDTX events indicate that the EasyDMA is finished accessing the RX or TX buffer in RAM.

### 7.38.2 Transmission

The first step of a DMA transmission is storing bytes in the transmit buffer and configuring EasyDMA. This is achieved by writing the initial address pointer to TXD.PTR, and the number of bytes to transmit from the RAM buffer to TXD.MAXCNT. The UARTe transmission is started by triggering the STARTTX task.

After each byte has been sent over the TXD line, a TXDRDY event will be generated.

When all bytes have been transmitted, the transmission will automatically end and the ENDTX event will be generated.

A UARTe transmission sequence is stopped by triggering the STOPTX task. A TXSTOPPED event will be generated when the UARTe transmitter has stopped.

If the ENDTX event has not already been generated when the UARTe transmitter has come to a stop, UARTe will generate the ENDTX event explicitly even though all bytes specified in the TXD.MAXCNT register have not been transmitted.

If flow control is enabled through the HWFC field in the CONFIG register, a transmission will be automatically suspended when CTS is deactivated and resumed when CTS is activated again, as shown in the following figure. A byte that is in transmission when CTS is deactivated will be fully transmitted before the transmission is suspended.

Figure 236: UART transmission

The UART transmitter is in its lowest activity level consuming the least amount of energy when it is stopped. That is, before it is started via STARTTX or after it has been stopped via STOPTX and the TXSTOPPED event has been generated. See [POWER — Power control](#) on page 46 for more information about power modes.

### 7.38.3 Reception

The UART receiver is started by triggering the STARTRX task. The UART receiver uses EasyDMA to store incoming data in an RX buffer in RAM.

The RX buffer is located at the address specified in the RXD.PTR register. The RXD.PTR register is double-buffered and it can be updated and prepared for the next STARTRX task immediately after the RXSTARTED event is generated. The size of the RX buffer is specified in the RXD.MAXCNT register. UART generates an ENDRX event when it has filled up the RX buffer, as seen in the following figure.

For each byte received over the RXD line, an RXDRDY event is generated. This event is likely to occur before the corresponding data has been transferred to Data RAM.

The RXD.AMOUNT register can be queried following an ENDRX event to see how many new bytes have been transferred to the RX buffer in RAM since the previous ENDRX event.

Figure 237: UARTE reception

The UARTE receiver is stopped by triggering the STOPRX task. An RXTO event is generated when the UARTE has stopped. UARTE makes sure that an impending ENDRX event is generated before the RXTO event is generated. This means that UARTE guarantees that no ENDRX event is generated after RXTO, unless UARTE is restarted or a FLUSHRX command is issued after the RXTO event is generated.

**Note:** If the ENDRX event has not been generated when the UARTE receiver stops, indicating that all pending content in the RX FIFO has been moved to the RX buffer, UARTE generates the ENDRX event explicitly even though the RX buffer is not full. In this scenario the ENDRX event is generated before the RXTO event is generated.

To determine the amount of bytes the RX buffer has received, the CPU can read the RXD.AMOUNT register following the ENDRX event or the RXT0 event.

UARTE can receive up to four bytes after the STOPRX task has been triggered, if these are sent in succession immediately after the RTS signal is deactivated.

After the RXT0 event is generated, the internal RX FIFO may still contain data. To move this data to RAM, the FLUSHRX task must be triggered. The RX buffer should be emptied, or the RXD.PTR register should be updated before the FLUSHRX task is triggered. This ensures the data in the RX buffer is not overwritten. To make sure that all data in the RX FIFO is moved to the RX buffer, the RXD.MAXCNT register must be set to  $RXD.MAXCNT > 4$ , as seen in the following figure. The UARTE will generate the ENDRX event after completing the FLUSHRX task even if the RX FIFO was empty or if the RX buffer does not fill up. After the ENDRX event, the RXD.AMOUNT register holds the actual amount of bytes transferred to the RX buffer.

Figure 238: UARTE reception with forced stop via STOPRX

If hardware flow control is enabled through the HWFC field in the CONFIG register, the RTS signal will be deactivated when the receiver is stopped via the STOPRX task or when the UARTE is only able to receive four more bytes in its internal RX FIFO.

With flow control disabled, the UARTE will function in the same way as when the flow control is enabled except that the RTS line will not be used. This means that no signal will be generated when the UARTE has reached the point where it is only able to receive four more bytes in its internal RX FIFO. Data received when the internal RX FIFO is filled up, will be lost.

The UARTE receiver will be in its lowest activity level, and consume the least amount of energy, when it is stopped, i.e. before it is started via STARTRX or after it has been stopped via STOPRX and the RXTO event has been generated. See [POWER — Power control](#) on page 46 for more information about power modes.

### 7.38.4 Error conditions

An ERROR event, in the form of a framing error, will be generated if a valid stop bit is not detected in a frame. Another ERROR event, in the form of a break condition, will be generated if the RXD line is held active low for longer than the length of a data frame. Effectively, a framing error is always generated before a break condition occurs.

An ERROR event will not stop reception. If the error was a parity error, the received byte is still transferred into Data RAM along with any following bytes. If a framing error occurs (wrong stop bit), that byte will not be stored into Data RAM but following incoming bytes will.

### 7.38.5 Using the UARTE without flow control

If flow control is not enabled, the interface will behave as if the CTS and RTS lines are kept active all the time.

### 7.38.6 Parity and stop bit configuration

Automatic even parity generation for both transmission and reception can be configured using the register [CONFIG](#) on page 755. If odd parity is desired, it can be configured using the register [CONFIG](#) on page 755. See the register description for details.

The amount of stop bits can also be configured through the register [CONFIG](#) on page 755.

### 7.38.7 Low power

To ensure lowest possible power consumption when the peripheral is not needed, stop and disable UARTE.

The STOPTH and STOPRX tasks may not be always needed (the peripheral might already be stopped), but if STOPTH and/or STOPRX is sent, software shall wait until the TXSTOPPED and/or RXTO event is received in response, before disabling the peripheral through the ENABLE register.

## 7.38.8 Pin configuration

The different signals RXD, CTS (Clear To Send, active low), RTS (Request To Send, active low), and TXD associated with UARTE are mapped to physical pins according to the configuration specified in the PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers respectively.

The PSEL.RXD, PSEL.CTS, PSEL.RTS, and PSEL.TXD registers and their configurations are only used as long as the UARTE is enabled, and retained only for the duration the device is in System ON mode. PSEL.RXD, PSEL.RTS, PSEL.RTS, and PSEL.TXD must only be configured when the UARTE is disabled.

To secure correct signal levels on the pins by the UARTE when in System OFF mode, the pins must be configured in the GPIO peripheral as described in the following table.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| UARTE signal | UARTE pin                | Direction | Output value   |
|--------------|--------------------------|-----------|----------------|
| RXD          | As specified in PSEL.RXD | Input     | Not applicable |
| CTS          | As specified in PSEL.CTS | Input     | Not applicable |
| RTS          | As specified in PSEL.RTS | Output    | 1              |
| TXD          | As specified in PSEL.TXD | Output    | 1              |

Table 80: GPIO configuration before enabling peripheral

   ## 7.38.10 Electrical specification

### 7.38.10.1 UARTE electrical specification

| Symbol            | Description                                            | Min. | Typ. | Max. | Units   |
|-------------------|--------------------------------------------------------|------|------|------|---------|
| $f_{UARTE}$       | Baud rate for UARTE <sup>34</sup> .                    |      |      | 1000 | kbps    |
| $t_{UARTE,CTSH}$  | CTS high time                                          | 0.5  |      |      | $\mu$ s |
| $t_{UARTE,START}$ | Time from STARTRX/STARTTX task to transmission started |      | 0.25 |      | $\mu$ s |

## 7.39 USBD — Universal serial bus device

The USB device (USBID) controller implements a full speed USB device function that meets 2.0 revision of the USB specification.

Figure 239: USB device block diagram

<sup>34</sup> High baud rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

Listed here are the main features for USB D:

- Implements full-speed (12 Mbps) device fully compliant to [Universal Serial Bus Specification Revision 2.0](#), including following engineering change notices (ECNs) issued by USB Implementers Forum:
  - *Pull-up/pull-down Resistors ECN*
  - *5V Short Circuit Withstand Requirement Change ECN*
- USB device stack available in the Nordic SDK
- Integrated (on-chip) USB transceiver (PHY)
- Software controlled on-chip pull-up on D+
- Endpoints:
  - 2 control (1 IN, 1 OUT)
  - 14 bulk/interrupt (7 IN, 7 OUT)
  - 2 isochronous (1 IN, 1 OUT)
- Supports double buffering for isochronous (ISO) endpoints (IN/OUT)
- Supports USB suspend, resume, and remote wake-up
- 64 bytes buffer size for each bulk/interrupt endpoint
- Up to 1023 bytes buffer size for ISO endpoints
- EasyDMA for all data transfers

### 7.39.1 USB device states

The behavior of a USB device can be modeled through a state diagram.

The *USB 2.0 Specification* (see *Chapter 9 USB Device Framework*) defines a number of states for a USB device, as shown in the following figure.

Figure 240: Device state diagram

The USB device must change state according to host-initiated traffic and USB bus states. It is up to the software to implement a state machine that matches the above definition. To detect the presence or absence of USB supply (VBUS), two events USBDETECTED and USBREMOVED can be used to implement the state machine. For more details on these events, see [USBREG — USB regulator control](#) on page 58.

When implementing the software, the USB host behavior shall never be assumed to be predictable. In particular the sequence of commands received during an enumeration. The software shall always react to the current bus conditions or commands sent by the USB host.

### 7.39.2 USB terminology

The USB specification defines bus states, rather than logic levels on the D+ and D- lines.

For a full speed device, the bus state where the D+ line is high and the D- line is low is defined as the J state. The bus state where D+ is low and D- high is called the K state.

An idle bus, where D+ and D- lines are only polarized through the pull-up on D+ and pull-downs on the USB host side, will be in J state.

Both lines low are called SE0 (single-ended 0), and both lines high SE1 (single-ended 1).

### 7.39.3 USB pins

The USB peripheral features a number of dedicated pins.

The dedicated USB pins can be grouped in two categories, signal and power. The signal pins consist of the **D+** and **D-** pins, which connect to the USB host. They are dedicated pins, and not available as standard GPIOs. The USB peripheral is implemented according to the [USB Specification v2.0, 5V Short Circuit Withstand ECN Requirement Change](#), meaning these two pins are not 5 V tolerant. USB power is supplied on the **VBUS** pin.

The signal pins and pull-up are operational when the following are true:

- When **VBUS** is in its valid voltage range
- USB is enabled through the [ENABLE](#) register

For more information about USB power supply and VBUS detection, see [USBREG — USB regulator control](#) on page 58. For pinout see [Pin assignments](#) on page 851.

### 7.39.4 USB power-up sequence

The physical layer interface (PHY) of the USB transceiver has its own power-supply pin **VBUS**, which affects USB power-up sequence.

The nRF5340 device is not able to properly signal its presence to the USB host and handle traffic from the USB host, unless the PHY power supply is enabled and stable. Turning the PHY power supply on or off is directly linked to register [ENABLE](#). nRF5340 provides events that help synchronizing software to the various steps during the power-up sequence.

To make sure that all resources in USB are available and the dedicated USB voltage regulator stabilized, the following is recommended:

- Enable USB only after VBUS has been detected
- Turn the USB pull-up on after the following events have occurred:
  - USBPWRRDY
  - USBEVENT, with the READY condition flagged in [EVENTCAUSE](#)

The following sequence chart illustrates a typical handling of VBUS power-up.

Figure 241: VBUS power-up sequence

Upon detecting VBUS removal, it is recommended to wait for ongoing EasyDMA transfers to finish before disabling USB (relevant ENDEPIN[n], ENDISOIN, ENDEPOUT[n], or ENDISOOUT events, see [EasyDMA](#) on page 762). The USBREMOVED event, described in [USBREG — USB regulator control](#) on page 58, signals when the VBUS is removed. Reading the ENABLE register will return Enabled until USB is completely disabled.

### 7.39.5 USB pull-up

The USB pull-up serves two purposes. It indicates to the USB host that the USB device is connected to the USB bus, and it indicates the USB device's speed capability.

When no pull-up is connected to the USB bus, the USB host detects both D+ and D- lines low, as they are pulled down on the USB host side by 15 kΩ resistors. The USB device is not detected by the USB host, putting it in a detached state, even if it is physically connected to the USB host. In this situation, the USB device is not allowed to draw current from VBUS, according to *USB 2.0 Specification*.

When a full-speed device connects its 1.5 kΩ pull-up to D+, the host sees the corresponding line high. The USB device is then in the attached state. During the enumeration process, the host attempts to determine if the full-speed device also supports higher speeds and initiates communication with the USB device to further identify it. USB supports only full-speed operation (12 Mbps), and ignores the requests for higher speeds.

Register **USBPULLUP** enables software to connect or disconnect the pull-up on D+. This allows the software to control when USB enumeration takes place. It also allows to emulate a physical disconnect from the USB bus, for instance when re-enumeration is required. **USBPULLUP** has to be enabled to allow USBSD to handle USB traffic and generate appropriate events. External pull-ups are not allowed.

Note that disconnecting the pull-up through register **USBPULLUP** while connected to a host, will result in both D+ and D- lines to be pulled low by the USB host's pull-down resistors. However, as mentioned above, this will also inhibit the generation of the USBRESET event. The pull-up is disabled by default after nRF5340 reset.

The pull-up shall only get connected after USBSD has been enabled through register **ENABLE**. The USB pull-up value is automatically changed depending on the bus activity, as specified in *Resistor ECN* which amends the original *USB 2.0 Specification*. The user does not have access to this function as it is handled in hardware.

While they should never be used in normal traffic activity, lines D+ and D- can be forced into state specified in register **DPDMVALUE** by the task **DPDMDRIVE**, after USBSD has been enabled and initialized. The USBSD Low-power mode must be disabled to ensure the line drivers are not disabled, by ensuring **LOWPOWER** = ForceNormal. The **DPDMNODRIVE** task stops driving them, and the PHY returns to normal operation.

## 7.39.6 USB reset

The USB specification defines a USB reset, which is not be confused with a reset of the nRF5340. The USB reset is a normal USB bus condition, and is used as part of the enumeration sequence, it does not reset the nRF5340.

The USB reset results from a single-ended low state (SE0) on lines D+/D- for a  $t_{\text{USB,DETRST}}$  amount of time. Only the USB host is allowed to drive a USB reset condition on the bus. USBSD automatically interprets a SE0 longer than  $t_{\text{USB,DETRST}}$  as a USB reset. When nRF5340 detects a USB reset and generates a USBRESET event, the USB stack and related parts of the application shall re-initialize themselves, and go back to the default state.

Some of the registers in USBSD get automatically reset to a known state, in particular all data endpoints are disabled and the **USBADDR** reset to 0.

After nRF5340 has connected to the USB bus (i.e. after VBUS is applied), the USB device shall not respond to any traffic from the time the pull-up is enabled until it has seen a USB reset condition. This is automatically ensured by USBSD.

After a USB reset, nRF5340 shall be fully responsive after at most  $T_{\text{RSTCY}}$  (according to chapter 7 in the USB specification). Software shall take into account the time it takes the hardware to recover from USB reset condition.

## 7.39.7 USB suspend and resume

Normally, the USB host will maintain activity on the USB bus at least every millisecond according to USB specification. A USB device will enter suspend when there is no activity on the USB bus (idle) for a given time. The USB device will resume operation when it receives any non idle signaling.

To signal that the USB device shall enter Low-power mode (suspend), the USB host stops activity on the USB bus, which becomes idle. Only the USB device pull-up and host pull-downs act on D+ and D-, and the USB bus is kept at a constant J state. It is up to the USB device to detect this lack of activity, and enter the Low-power mode (suspend) within a specified time.

The USB host can decide to suspend or resume USB activity at any time. If remote wake-up is enabled, the USB device may signal to the USB host to resume from suspend.

### 7.39.7.1 Entering suspend

USBSD automatically detects lack of activity on the USB bus for more than a defined amount of time.

When no activity has been detected for longer than  $t_{\text{USB,SUSPEND}}$ , USBD generates the USBEVENT event with SUSPEND bit set in register **EVENTCAUSE**. The software shall ensure that the current drawn from the USB supply line VBUS is within the specified limits before  $T_{2\text{SUSP}}$ , as defined in chapter 7 of the USB specification. In order to reduce idle current of USBD, the software must explicitly place USBD in Low-power mode by writing `LowPower` to register **LOWPOWER**.

In order to save power, and provided that no other peripheral needs it, the crystal oscillator (HFXO) in CLOCK may be disabled by software during the USB suspend, while the USB pull-up is disconnected, or when VBUS is not present. Software must explicitly enable it at any other time. USBD is not able to respond to USB traffic unless HFXO is enabled and stable.

### 7.39.7.2 Host-initiated resume

Once the USB host resumes the USB bus activity, the USB device has to be responsive to incoming requests on the USB bus within the time  $T_{\text{RSMRCY}}$  (as defined in chapter 7 of the USB specification) and revert to Normal power consumption mode.

If the USB host resumes USB bus activity with or without a RESUME condition (in other words: the USB bus activity is defined as any non-J state), USBD will generate a USBEVENT event, with RESUME bit set in register **EVENTCAUSE**. If the USB host resumes bus activity simply by restarting sending frames, USBD will generate SOF events.

### 7.39.7.3 Device-initiated remote wake-up

Assuming the remote wake-up is supported by the USB device and enabled by the USB host, the device can request the USB host to resume from suspend if the wake-up condition is met.

To do so, the HFXO needs to be enabled first. After waking up the HFXO, the software must bring USBD out of Low-power mode and set Normal mode by writing `ForceNormal` in register **LOWPOWER**. It can then instruct USBD to drive a RESUME condition (K state) on the USB bus by triggering the DPDMDRIVE task, attempting to wake up the USB host. By choosing `Resume` in **DPDMVALUE**, the duration of the RESUME state is under hardware control ( $t_{\text{USB,DRIVEK}}$ ). By choosing J or K, the duration of that state is under software control (the J or K state is maintained until a DPDMNODRIVE task is triggered) and has to meet  $T_{\text{DRSMUP}}$  as specified in USB specification chapter 7.

Upon writing the `ForceNormal` in register **LOWPOWER**, a USBEVENT event is generated with the USBWUALLOWED bit set in register **EVENTCAUSE**.

The value in register **DPDMVALUE** on page 796 will only be captured and used when the DPDMDRIVE task is triggered. This value defines the state the USB bus will be forced into after the DPDMDRIVE task.

The USB device must not initiate a remote wake-up request before  $T_{\text{WTRSM}}$  (according to USB specification chapter 7) after the USB bus has entered idle state. Using the recommended resume value in **DPDMVALUE** (rather than K) takes care of this, and postpones the RESUME state accordingly.

## 7.39.8 EasyDMA

USB implements EasyDMA for accessing memory without CPU involvement.

Each endpoint has an associated set of registers, tasks, and events. EasyDMA and traffic on the USB bus are closely related. Several events provide insight on USB bus activity, with a number of tasks allowing an automated response to the traffic.

**Note:** Endpoint 0 (IN and OUT) are implemented as control endpoint. For more information, see [Control transfers](#) on page 764.

## Registers

Enabling endpoints is controlled through the **EPINEN** and **EPOUTEN** registers.

The following registers define the memory address of the buffer for a specific IN or OUT endpoint:

- [EPIN\[n\].PTR](#), (n=0..7)
- [EPOUT\[n\].PTR](#), (n=0..7)
- [ISOIN.PTR](#)
- [ISOOUT.PTR](#)

The following registers define the amount of bytes to be sent on the USB bus for next transaction:

- [EPIN\[n\].MAXCNT](#), (n=0..7)
- [ISOIN.MAXCNT](#)

The following registers define the length of the buffer (in bytes) for next transfer of incoming data:

- [EPOUT\[n\].MAXCNT](#), (n=1..7)
- [ISOOUT.MAXCNT](#)

Since the USB host decides how many bytes are sent over the USB bus, the MAXCNT value can be copied from register [SIZE.EPOUT\[n\]](#) (n=1..7) or register [SIZE.ISOOUT](#).

Register [EPOUT\[0\].MAXCNT](#) defines the length of the OUT buffer (in bytes) for the control endpoint 0. Register [SIZE.EPOUT\[0\]](#) shall indicate the same value as `MaxPacketSize` from the USB device descriptor or `wLength` from the SETUP command, whichever is the least.

The [.AMOUNT](#) registers indicate how many bytes actually have been transferred over EasyDMA during the last transfer.

Stalling bulk/interrupt endpoints is controlled through the [EPSTALL](#) register.

**Note:** Due to USB specification requirements, the effect of the stalling control endpoint 0 may be overridden by hardware, in particular when a new SETUP token is received.

EasyDMA will not copy the SETUP data to memory (it will only transfer data from the Data stage). The following are separate registers in USB\_D that have setup data.

- [BMREQUESTTYPE](#)
- [BREQUEST](#)
- [WVALUEL](#)
- [WVALUEH](#)
- [WINDEXL](#)
- [WINDEXH](#)
- [WLENGTHL](#)
- [WLENGTHH](#)

The [EVENTCAUSE](#) register provides details on what caused a given USBEVENT event, for instance if a CRC error is detected during a transaction, or if bus activity stops or resumes.

## Tasks

Tasks [STARTEPIN\[n\]](#), [STARTEPOUT\[n\]](#) (n=0..7), [STARTISOIN](#), and [STARTISOOUT](#) capture the values for [.PTR](#) and [.MAXCNT](#) registers. For IN endpoints, a transaction over the USB bus is automatically triggered when the EasyDMA transfer is complete. For OUT endpoints, it is up to software to allow the next transaction over the USB bus. See the examples in [Control transfers](#) on page 764, [Bulk and interrupt transactions](#) on page 768, and [Isochronous transactions](#) on page 771.

For the control endpoint 0, OUT transactions are allowed through the [EPORCVOUT](#) task. The [EPOSTATUS](#) task allows a Status stage to be initiated, and the [EPOSTALL](#) task allows stalling further traffic (Data or Status stage) on the control endpoint.

## Events

The **STARTED** event confirms that the values of the .PTR and .MAXCNT registers of the endpoints flagged in register **EPSTATUS** have been captured. Those can then be modified by software for the next transfer.

Events **ENDEPIN[n]**, **ENDEPOUT[n]** (n=0..7), **ENDISOIN**, and **ENDISOOUT** events indicate that the entire buffer has been consumed. The buffer can be accessed safely by the software.

Only a single EasyDMA transfer can take place in USB at any time. Software must ensure that tasks **STARTEPIN[n]** (n=0..7), **STARTISOIN**, **STARTEPOUT[n]** (n=0..7), or **STARTISOOUT** are not triggered before events **ENDEPIN[n]** (n=0..7), **ENDISOIN**, **ENDEPOUT[n]** (n=0..7), or **ENDISOOUT** are received from an on-going transfer.

The **EPDATA** event indicates that a successful (acknowledged) data transaction has occurred on the data endpoint(s) flagged in register **EPDATASTATUS**. A successful (acknowledged) data transaction on endpoint 0 is signalled by the **EPODATADONE** event.

At any time a **USBEVENT** event may be sent, with details provided in **EVENTCAUSE** register.

The **EPOSETUP** event indicates that a SETUP token has been received on the control endpoint 0, and that the setup data is available in the [setup data registers](#).

### 7.39.9 Control transfers

The USB specification mandates every USB device to implement endpoint 0 IN and OUT as control endpoints.

A control transfer consists of two or three stages:

- Setup stage
- Data stage (optional)
- Status stage

Each control transfer can be one of following types:

- Control read
- Control read no data
- Control write
- Control write no data

An **EPOSETUP** event indicates that the data in the setup stage (following the SETUP token) is available in [registers](#).

The data in the Data stage (following the IN or OUT token) is transferred from or to the desired location using EasyDMA.

The control endpoint buffer can be of any size.

After receiving the SETUP token, the USB controller will not accept (NAK) any incoming IN or OUT tokens until the software has finished decoding the command, determined the type of transfer, and prepared for the next stage (Data or Status) appropriately.

The software can stall a command when in the Data and Status stages, through the **EPOSTALL** task, when the command is not supported or if its wValue, wIndex or wLength parameters are wrong. The following shows a stalled control read transfer, but the same mechanism (tasks) applies to stalling a control write transfer.

Figure 242: Control read gets stalled

See the *USB 2.0 Specification* and relevant class specifications for rules on stalling commands.

**Note:** The USB peripheral handles the SetAddress transfer by itself. As a consequence, the software shall not process this command other than updating its state machine (see [Device state diagram](#)), nor initiate a status stage. If necessary, the address assigned by the USB host can be read out from the USBADDR register after the command has been processed.

### 7.39.9.1 Control read transfer

This section describes how the software behaves when responding to a control read transfer.

As mentioned earlier, the USB controller will not accept (NAK) any incoming IN tokens until software has finished decoding the command, determining the type of transfer, and preparing for the next stage (Data or Status) appropriately.

For a control read, transferring the data from memory into USBD will trigger a valid, acknowledged (ACK) IN transaction on the USB bus.

The software has to prepare EasyDMA by pointing to the buffer containing the data to be transferred. If no other EasyDMA transfers are on-going with USBD, the software can send the STARTEPIN0 task, which will initiate the data transfer and transaction on the USB bus.

A STARTED event (with EPIN0 bit set in the [EPSTATUS](#) register) will be generated as soon as the EPIN[0].PTR and .MAXCNT registers have been captured. Software may then prepare them for the next data transaction.

An ENDEPIN[0] event will be generated when the data has been transferred from memory to the USB peripheral.

Finally, an EP0DATADONE event will be generated when the data has been transmitted over the USB bus and acknowledged by the USB host.

The software can then either prepare and transmit the next data transaction by repeating the above sequence, or initiate the Status stage through the EPOSTATUS task.

Figure 243: Control read transfer

It is possible to enable a shortcut from the EP0DATADONE event to the EPOSTATUS task, typically if the Data stage is expected to take a single transfer. If there is no data stage, the software can initiate the Status stage through the EPOSTATUS task right away, as shown in the following figure.

Figure 244: Control read no data transfer

### 7.39.9.2 Control write transfer

This section describes how the software responds to a control write transfer.

The software has to prepare EasyDMA by pointing to the buffer in memory that shall contain the incoming data. If no other EasyDMA transfers are ongoing with USB, the software can then send the **EP0RCVOUT** task, which will make USB acknowledge (ACK) the first OUT+DATA transaction from the USB host.

An **EP0DATADONE** event will be generated when a new OUT+DATA has been transmitted over the USB bus, before being acknowledged by the USB device.

After receiving the first transaction, a **STARTED** event (the **EPOUT0** bit set in the **EPSTATUS** register) is generated when the **EPOUT[0].PTR** and **.MAXCNT** registers have been captured. Software may then prepare them for the next data transaction.

An **ENDEPOUT[0]** event will be generated when the data has been transferred from USB to memory. The software can then either prepare to receive the next data transaction by repeating the above sequence, or initiate the Status stage through the **EP0STATUS** task. Until then, further incoming OUT+DATA transactions get a NAK response by the USB device.

Figure 245: Control write transfer

Figure 246: Control write no data transfer

### 7.39.10 Bulk and interrupt transactions

The USB\_D peripheral implements seven pairs of bulk/interrupt endpoints.

The bulk/interrupt endpoints have a fixed USB endpoint number, summarized in the following table.

| Bulk endpoint # | USB IN endpoint | USB OUT endpoint |
|-----------------|-----------------|------------------|
| [1]             | 0x81            | 0x01             |
| [2]             | 0x82            | 0x02             |
| [3]             | 0x83            | 0x03             |
| [4]             | 0x84            | 0x04             |
| [5]             | 0x85            | 0x05             |
| [6]             | 0x86            | 0x06             |
| [7]             | 0x87            | 0x07             |

Table 81: Bulk/interrupt endpoint numbering

A bulk/interrupt transaction consists of a single Data stage. Two consecutive, successful transactions are distinguished through alternating leading process ID (PID): DATA0 follows DATA1, DATA1 follows DATA0, etc. A repeated transaction is detected by re-using the same PID as previous transaction, i.e. DATA0 follows DATA0, or DATA1 follows DATA1.

The USBD controller automatically toggles DATA0/DATA1 PIDs for every bulk/interrupt transaction.

If incoming data is corrupted (CRC does not match), USBD automatically prevents DATA0/DATA1 from toggling, to request the USB host to resend the data.

In some specific cases, the software may want to force a data toggle (usually reset) on a specific IN endpoint, or force the expected toggle on an OUT endpoint, for instance as a consequence of the USB host issuing **ClearFeature**, **SetInterface**, or selecting an alternate setting. Controlling the data toggle of data IN or OUT endpoint  $n$  ( $n=1..7$ ) is done through register **DTOGGLE**.

The bulk/interrupt transaction in USB full-speed can be of any size up to 64 bytes. It must be a multiple of four bytes and 32-bit aligned in memory.

When the USB transaction has completed, an EPDATA event is generated. Until new data has been transferred by EasyDMA from memory to USBD (signalled by the ENDEPIN[n] event), the hardware will automatically respond with NAK to all incoming IN tokens. Software has to configure and start the EasyDMA transfer once it is ready to send more data.

Each IN or OUT data endpoint has to be explicitly enabled by software through register **EPINEN** or **EPOUTEN**, according to the configuration declared by the USB device and selected by the USB host through the **SetConfig** command.

A disabled data endpoint will not respond to any traffic from the USB host. An enabled data endpoint will normally respond NAK or ACK (depending on the readiness of the buffers), or STALL (if configured in register **EPSTALL**), in which case the endpoint is asked to halt. The **Halted** or **NotHalted** state of a given endpoint can be read back from register **HALTED.EPIN[n]** or **HALTED.EPOUT[n]**. The format of the returned 16-bit value can be copied as is, as a response to a **GetStatusEndpoint** request from the USB host.

Enabling or disabling an endpoint will not change its Halted state. However, a USB reset will disable and clear the Halted state of all data endpoints.

The control endpoint 0 IN and OUT can also be enabled and/or halted using the same mechanisms, but due to USB specification, receiving a SETUP will override its state.

### 7.39.10.1 Bulk and interrupt IN transaction

The host issues IN tokens to receive bulk/interrupt data. In order to send data, the software has to enable the endpoint and prepare an EasyDMA transfer on the desired endpoint.

Bulk/interrupt IN endpoints are enabled or disabled through their respective INn bit ( $n=1..7$ ) in **EPINEN** register.

It is also possible to stall or resume communication on an endpoint through the **EPSTALL** register.

Figure 247: Bulk/interrupt IN transaction

It is possible (and in some situations it is required) to respond to an IN token with a zero-length data packet.

**Note:** On many USB hosts, not responding (DATA+ACK or NAK) to three IN tokens on an interrupt endpoint would have the USB host disable that endpoint as a consequence. Re-enumerating the USB device (unplug-replug) may be required to restore functionality. Make sure that the relevant data endpoints are enabled for normal operation as soon as the USB device gets configured through a **SetConfig** request.

### 7.39.10.2 Bulk and interrupt OUT transaction

When the USB host wants to transmit bulk/interrupt data, it issues an OUT token (packet) followed by a DATA packet on a given endpoint  $n$  ( $n=1..7$ ).

A NAK is returned until the software writes any value to register [SIZE.EPOUT\[n\]](#), indicating that the content of the local buffer can be overwritten. Upon receiving the next OUT+DATA transaction, an ACK is returned to the USB host while an EPDATA event is generated (and the [EPDATASTATUS](#) register flags are set to indicate on which endpoint this happened). Once the EasyDMA is prepared and enabled, by writing the [EPOUT\[n\]](#) registers and triggering the **STARTEPOUT[n]** task, the incoming data will be transferred to memory. Until that transfer is finished, the hardware will automatically NAK any other incoming OUT+DATA packets. Only when the EasyDMA transfer is done (signalled by the **ENDEPOUT[n]** event), or as soon as any values are written by the software in register [SIZE.EPOUT\[n\]](#), the endpoint  $n$  will accept incoming OUT+DATA again.

It is allowed for the USB host to send zero-length data packets.

Bulk/interrupt OUT endpoints are enabled or disabled through their respective OUT $n$  bit ( $n=1..7$ ) in the [EPOUTEN](#) register. It is also possible to stall or resume communication on an endpoint through the [EPSTALL](#) register.

Figure 248: Bulk/interrupt OUT transaction

### 7.39.11 Isochronous transactions

The USB peripheral implements isochronous (ISO) endpoints.

The ISO endpoints have a fixed USB endpoint number, summarized in the following table.

| ISO endpoint # | USB IN endpoint | USB OUT endpoint |
|----------------|-----------------|------------------|
| [0]            | 0x88            | 0x08             |

Table 82: Isochronous endpoint numbering

An isochronous transaction consists of a single, non-acknowledged Data stage. The host sends out a start of frame at a regular interval (1 ms), and data follows IN or OUT tokens within each frame.

EasyDMA allows transferring ISO data directly from and to memory. EasyDMA transfers must be initiated by the software, which can synchronize with the SOF (start of frame) events.

Because the timing of the start of frame is very accurate, the SOF event can be used for jobs such as synchronizing a local timer through the SOF event and PPI. The SOF event gets synchronized to the 16 MHz clock prior to being made available to the PPI.

Every start of frame increments a free-running counter, which can be read by software through the `FRAMECNTR` register.

Each IN or OUT ISO data endpoint has to be explicitly enabled by software through register `EPINEN` or `EPOUTEN`, according to the configuration declared by the USB device and selected by the USB host through the `SetConfig` command. A disabled ISO IN data endpoint will not respond to any traffic from the USB host. A disabled ISO OUT data endpoint will ignore any incoming traffic from the host.

The USB peripheral has an internal 1 kB buffer associated with ISO endpoints. The user can either allocate the full amount to the IN or the OUT endpoint, or split the buffer allocation between the two using register `ISOSPLIT`.

The internal buffer also sets the maximum size of the ISO OUT and ISO IN transfers: 1023 bytes when the full buffer is dedicated to either ISO OUT or ISO IN, and half when the buffer is split between the two.

### 7.39.11.1 Isochronous IN transaction

When the USB host wants to receive isochronous (ISO) data, it issues an IN token on the isochronous endpoint.

After the data has been transferred using the EasyDMA, the USB controller on the isochronous IN endpoint responds to the IN token with the transferred data using the `ISOIN.MAXCNT` for the size of the packet.

The ISO IN data endpoint has to be explicitly enabled by software through the `ISOIN0` bit in register `EPINEN`.

When an ISO IN endpoint is enabled and no data transferred with EasyDMA, the response of the USB D depends on the setting of the `RESPONSE` field in register `ISOINCONFIG`. It can either provide no response to an IN token or respond with a zero-length data.

If the EasyDMA transfer on the isochronous endpoint is not completed before the next SOF event, the result of the transfer is undefined.

The maximum size of an ISO IN transfer in USB full-speed is 1023 bytes. The data buffer has to be a multiple of 4 bytes 32-bit aligned in memory. However, the amount of bytes transferred on the USB data endpoint can be of any size (up to 1023 bytes, if not shared with an OUT ISO endpoint).

Figure 249: Isochronous IN transfer

### 7.39.11.2 Isochronous OUT transaction

When the USB host wants to send isochronous (ISO) data, it issues an OUT token on the isochronous endpoint, followed by data.

The ISO OUT data endpoint has to be explicitly enabled by software through the `ISOOUT0` bit in register `EPOUTEN`.

The amount of last received ISO OUT data is provided in the `SIZE.ISOOUT` register. Software shall interpret the `ZERO` and `SIZE` fields as presented in the following table.

| ZERO     | SIZE              | Last received data size          |
|----------|-------------------|----------------------------------|
| Normal   | 0                 | No data received at all          |
| Normal   | 1..1023           | 1..1023 bytes of data received   |
| ZeroData | (not of interest) | Zero-length data packet received |

Table 83: ISO OUT incoming data size

When EasyDMA is prepared and started, triggering a STARTISOOUT task initiates an EasyDMA transfer to memory. Software shall synchronize ISO OUT transfers with the SOF events. EasyDMA uses the address in `ISOOUT.PTR` and size in `ISOOUT.MAXCNT` for every new transfer.

If the EasyDMA transfer on the isochronous endpoint is not completed before the next SOF event, the result of the transfer is undefined.

The maximum size of an isochronous OUT transfer in USB full-speed is 1023 bytes. The data buffer has to be a multiple of 4 bytes and 32-bit aligned in Data RAM. However, the amount of bytes transferred on the USB data endpoint can be of any size (up to 1023 bytes if not shared with an IN ISO endpoint).

If the last received ISO data packet is corrupted (wrong CRC), the USB controller generates an USBEVENT event (at the same time as SOF) and indicates a CRC error on ISOOUTCRC in register `EVENTCAUSE`. EasyDMA will transfer the data anyway if it has been set up properly.

Figure 250: Isochronous OUT transfer

### 7.39.12 USB register access limitations

Some of the registers in USBBD cannot be accessed in specific conditions.

This may be the case when USBBD is not enabled (using the `ENABLE` register) and ready (signalled by the `READY` bit in `EVENTCAUSE` after a USBEVENT event), or when USBBD is in Low-power mode while the USB bus is suspended.

Triggering any tasks, including the tasks triggered through the PPI, is affected by this behavior. In addition, the following registers are affected:

- HALTED.EPIN[0..7]
- HALTED.EPOUT[0..7]
- USBADDR
- BMREQUESTTYPE
- BREQUEST
- WVALUEL
- WVALUEH
- WINDEXL
- WINDEXH
- WLENGTHL
- WLENGTHH
- SIZE.EPOUT[0..7]
- SIZE.ISOOUT
- USBPULLUP
- DTOGGLE
- EPINEN
- EPOUTEN
- EPSTALL
- ISOSPLIT
- FRAMECNTR

### 7.39.13 Registers

#### Instances

| Instance  | Domain      | Base address | TrustZone |     |     | Split access | Description                 |
|-----------|-------------|--------------|-----------|-----|-----|--------------|-----------------------------|
|           |             |              | Map       | Att | DMA |              |                             |
| USBD : S  | APPLICATION | 0x50036000   | US        | S   | SA  | No           | Universal serial bus device |
| USBD : NS |             | 0x40036000   |           |     |     |              |                             |

#### Register overview

| Register               | Offset | TZ | Description                                                                                                             |
|------------------------|--------|----|-------------------------------------------------------------------------------------------------------------------------|
| TASKS_STARTEPIN[n]     | 0x004  |    | Captures the EPIN[n].PTR and EPIN[n].MAXCNT registers values, and enables endpoint IN n to respond to traffic from host |
| TASKS_STARTISOIN       | 0x024  |    | Captures the ISOIN.PTR and ISOIN.MAXCNT registers values, and enables sending data on ISO endpoint                      |
| TASKS_STARTEPOUT[n]    | 0x028  |    | Captures the EPOUT[n].PTR and EPOUT[n].MAXCNT registers values, and enables endpoint n to respond to traffic from host  |
| TASKS_STARTISOOUT      | 0x048  |    | Captures the ISOOUT.PTR and ISOOUT.MAXCNT registers values, and enables receiving of data on ISO endpoint               |
| TASKS_EP0RCVOUT        | 0x04C  |    | Allows OUT data stage on control endpoint 0                                                                             |
| TASKS_EP0STATUS        | 0x050  |    | Allows status stage on control endpoint 0                                                                               |
| TASKS_EP0STALL         | 0x054  |    | Stalls data and status stage on control endpoint 0                                                                      |
| TASKS_DPDMMDRIVE       | 0x058  |    | Forces D+ and D- lines into the state defined in the DPDMVALUE register                                                 |
| TASKS_DPDMNODRIVE      | 0x05C  |    | Stops forcing D+ and D- lines into any state (USB engine takes control)                                                 |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

       ## 7.39.14 Electrical specification

### 7.39.14.1 USB Electrical Specification

| Symbol                     | Description                                                              | Min. | Typ. | Max.  | Units |
|----------------------------|--------------------------------------------------------------------------|------|------|-------|-------|
| R <sub>USB,PU,ACTIVE</sub> | Value of pull-up on D+, bus active (upstream device transmitting)        | 1425 | 2300 | 3090  | Ω     |
| R <sub>USB,PU,IDLE</sub>   | Value of pull-up on D+, bus idle                                         | 900  | 1200 | 1575  | Ω     |
| t <sub>USB,DETRST</sub>    | Minimum duration of an SE0 state to be detected as a USB reset condition |      |      | 10    | μs    |
| f <sub>USB,CLK</sub>       | Frequency of local clock, USB active                                     |      | 48   |       | MHz   |
| f <sub>USB,TOL</sub>       | Accuracy of local clock, USB active <sup>35</sup>                        |      |      | ±1000 | ppm   |
| T <sub>USB,JITTER</sub>    | Jitter on USB local clock, USB active                                    |      |      | ±1    | ns    |

## 7.40 VMC — Volatile memory controller

VMC provides power control for RAM blocks.

<sup>35</sup> The local clock can be stopped during USB suspend

Each RAM block, which may contain multiple RAM sections, can power up or power down independently in System ON and System OFF mode using RAM[n] registers. See the [Memory](#) chapter for more information about RAM blocks and sections.

### 7.40.1 RAM power states

The RAM power control registers are used for configuring the following:

- The RAM sections to be retained during System OFF
- The RAM sections to be retained and accessible during System ON

In System OFF, retention of a RAM section is configured in the RETENTION field of the corresponding register [RAM\[n\].POWER \(n=0..7\)](#) on page 804.

In System ON, retention and accessibility for a RAM section is configured in the RETENTION and POWER fields of the corresponding register [RAM\[n\].POWER \(n=0..7\)](#) on page 804.

The following table summarizes the behavior of these registers.

| Configuration |                    |                        | RAM section status |          |
|---------------|--------------------|------------------------|--------------------|----------|
| System on/off | RAM[n].POWER.POWER | RAM[n].POWER.RETENTION | Accessible         | Retained |
| Off           | x                  | Off                    | No                 | No       |
| Off           | x                  | On                     | No                 | Yes      |
| On            | Off                | Off                    | No                 | No       |
| On            | Off                | On                     | No                 | Yes      |
| On            | On                 | x                      | Yes                | Yes      |

Table 84: RAM section configuration

The advantage of not retaining RAM contents is that the overall current consumption is reduced.

See chapter [Memory](#) on page 21 for more information on RAM sections.

### 7.40.2 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description                |
|----------|-------------|--------------|-----------|-----|-----|--------------|----------------------------|
|          |             |              | Map       | Att | DMA |              |                            |
| VMC : S  | APPLICATION | 0x50081000   | US        | S   | NA  | No           | Volatile memory controller |
| VMC : NS |             | 0x40081000   |           |     |     |              |                            |
| VMC      | NETWORK     | 0x41081000   | HF        | NS  | NA  | No           | Volatile memory controller |

#### Configuration

| Instance | Domain      | Configuration            |
|----------|-------------|--------------------------|
| VMC : S  | APPLICATION |                          |
| VMC : NS |             |                          |
| VMC      | NETWORK     | 4 RAM blocks implemented |
|          |             | 4 RAM slaves implemented |

<sup>36</sup> RAM section power off gives negligible reduction in current consumption when retention is on.

## Register overview

| Register        | Offset | TZ | Description                         |
|-----------------|--------|----|-------------------------------------|
| RAM[n].POWER    | 0x600  |    | RAM[n] power control register       |
| RAM[n].POWERSET | 0x604  |    | RAM[n] power control set register   |
| RAM[n].POWERCLR | 0x608  |    | RAM[n] power control clear register |

### 7.40.2.1 RAM[n].POWER (n=0..7)

## 7.41 WDT — Watchdog timer

The countdown watchdog timer (WDT) uses the low-frequency clock source (LFCLK) and offers configurable and robust protection against application lock-up.

WDT must be configured before it is started. After configuration, WDT is started by triggering the START task.

When WDT is running, its configuration registers (CRV, RREN, and CONFIG) are blocked for further configuration.

WDT can be paused while the CPU is sleeping, or when the debugger has halted the CPU. WDT is implemented as a down-counter that generates a TIMEOUT event when it wraps over after counting down to 0. When WDT is started by the START task, the watchdog counter is loaded with the value specified in the CRV register. This counter is also reloaded with the value specified in the CRV register when a reload request is granted.

The timeout period for the watchdog is given by the following equation:

$$\text{timeout [s]} = ( \text{CRV} + 1 ) / 32768$$

When started, WDT will make the 32.768 kHz RC oscillator start if no other 32.768 kHz clock source is running and generating the 32.768 kHz system clock, see chapter [CLOCK — Clock control](#) on page 72.

### 7.41.1 Reload criteria

WDT has eight separate reload request registers. These registers are used to request WDT to reload its counter with the value specified in the CRV register. To reload the watchdog counter, write 0x6E524635 to all enabled reload registers.

One or more RR registers can be individually enabled through the RREN register.

### 7.41.2 Temporarily pausing the watchdog

By default, the watchdog will be active counting down the down-counter while the CPU is sleeping. It is possible to configure the watchdog to automatically pause when the CPU is sleeping or when it is stopped by the debugger.

Entering System OFF mode will stop and disable the watchdog.

### 7.41.3 Watchdog reset

A TIMEOUT event automatically leads to a watchdog reset.

If the watchdog is configured to generate an interrupt on the TIMEOUT event, the watchdog reset is postponed by two 32.768 kHz clock cycles after the TIMEOUT event is generated. Once the TIMEOUT event is generated, and unless the watchdog is stopped, the impending watchdog reset will occur.

The watchdog can be reset from several reset sources, see [Application core reset behavior](#) on page 67. After a reset, the watchdog configuration registers are available for configuration.

See [RESET — Reset control](#) on page 65 for more information about reset sources.

### 7.41.4 Stopping the watchdog

By default, the watchdog cannot be stopped. It is possible to configure the watchdog to allow the STOP task.

To stop the watchdog, perform the following steps.

1. Set the [CONFIG](#) register's STOPEN field to `Enable` during watchdog configuration.
2. Write the special value 0x6E524635 to the [TSEN](#) register.
3. Invoke the STOP task.

When these conditions are met, the watchdog is stopped and a STOPPED event is issued.

When the watchdog is stopped, its configuration registers [CRV](#), [RREN](#), and [CONFIG](#) are no longer blocked.

**Note:** It is recommended to write zeros to [TSEN](#) on page 812 after the watchdog has stopped, to avoid runaway code triggering the STOP task.

### 7.41.5 Registers

#### Instances

| Instance  | Domain      | Base address | TrustZone |     |     | Split access | Description      |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | ## 7.41.6 Electrical specification

### 7.41.6.1 Watchdog Timer Electrical Specification

| Symbol           | Description       | Min. | Typ. | Max. | Units |
|------------------|-------------------|------|------|------|-------|
| t <sub>WDT</sub> | Time out interval | ..   | ..   | ..   |       |

# 8 Debug and trace

The debug and trace system offers a flexible and powerful mechanism for non-intrusive debugging.

Figure 251: Debug and trace overview

The main features of the debug and trace system are:

- Access port connection to application core Arm Cortex-M33
  - Eight breakpoints
  - Four watchpoint comparators
  - Instrumentation trace macrocell (ITM)
  - Embedded trace macrocell (ETM)
  - Access protection through APPROTECT, ERASEPROTECT and SECUREAPPROTECT
- Access port connection to network core Arm Cortex-M33
  - Eight breakpoints
  - Four watchpoints
  - Access protection through APPROTECT and ERASEPROTECT
- Serial wire debug (SWD) interface protocol version 2 with multidrop support
- Trace port interface unit (TPIU)

- 4-bit parallel trace of ITM and ETM trace data
- Serial wire output (SWO) trace of ITM data

## 8.1 DAP — Debug access port

An external debugger can access the device using the DAP.

The DAP is a standard Arm CoreSight™ serial wire debug port (SW-DP) that implements the serial wire debug (SWD) protocol with a two-pin serial interface (**SWDCLK** and **SWDIO**).

### Note:

- The SWDIO line has an internal pull-up resistor.
- The SWDCLK line has an internal pull-down resistor.

There are several access ports that connect to different parts of the system. See the following table for more information.

| AP ID | Type    | Description                               |
|-------|---------|-------------------------------------------|
| 0     | AHB-AP  | Application subsystem access port         |
| 1     | AHB-AP  | Network subsystem access port             |
| 2     | CTRL-AP | Application subsystem control access port |
| 3     | CTRL-AP | Network subsystem control access port     |

Table 85: Access port overview

The AHB-AP and APB-AP access ports are standard Arm components documented in the *Arm CoreSight SoC-400 Technical Reference Manual, Revision r3p2*. The CTRL-AP access port is proprietary (see [CTRL-AP - Control access port](#) on page 826).

### 8.1.1 Registers

#### Register overview

| Register                 | Offset | TZ | Description                                                                                                                                                                                                                                   |
|--------------------------|--------|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">TARGETID</a> | 0x042  |    | The TARGETID register provides information about the target when the host is connected to a single device.<br><br>The TARGETID register is accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x2. |
| <a href="#">DLPIDR</a>   | 0x043  |    | The DLPIDR register provides information about the serial wire debug protocol version.<br><br>Accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x3.                                              |

#### 8.1.1.1 TARGETID

Address offset: 0x042

The TARGETID register provides information about the target when the host is connected to a single device.

The TARGETID register is accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x2.

|                  |     |           |            |                                                                                       |                                                                                                              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 8.1.1.2 DLPIDR

Address offset: 0x043

The DLPIDR register provides information about the serial wire debug protocol version.

Accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x3.

|                  |     |           |          |                                                                                       |                                                   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |         |  |  |  |

## 8.1.2 Electrical specification

### 8.1.2.1 SW-DP

| Symbol       | Description                                       | Min.  | Typ. | Max. | Units      |
|--------------|---------------------------------------------------|-------|------|------|------------|
| $R_{pull}$   | Internal SWDIO and SWDCLK pull up/down resistance |       | 13   |      | k $\Omega$ |
| $f_{SWDCLK}$ | SWDCLK frequency                                  | 0.125 |      | 8    | MHz        |

### 8.1.2.2 Trace port

| Symbol    | Description                                                                                                                                                 | Min.   | Typ. | Max. | Units |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|------|------|-------|
| $T_{cyc}$ | Clock period, as defined by Arm in Embedded Trace Macrocell Architecture Specification (see Timing specifications in Trace Port Physical Interface section) | 15.625 |      | 250  | ns    |

## 8.2 Access port protection

The control access ports are always accessible from the debugger, while access to the system resources through each core's individual access ports (AHB-AP) can be protected in different ways.

The following tables give an overview of the access port protection methods.

| Registers                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UICR.APPROTECT and CTRL-AP.APPROTECT.DISABLE             | These registers control the generation of the application core AHB-AP DBGEN signal, which controls all non-secure access through the application core AHB-AP. This can be used to provide readback protection of the flash contents. See also <a href="#">Application core access port protection for non-secure debug access</a> on page 817. For more information about the DBGEN signal, see the <i>Arm CoreSight SoC-400 Technical Reference Manual, Revision r3p2</i> .                                                                                        |
| UICR.SECUREAPPROTECT and CTRL-AP.SECUREAPPROTECT.DISABLE | <p>These registers control the generation of the application core AHB-AP SPIDEN signal, which blocks all secure access through the application core AHB-AP. This means that only the non-secure code can be debugged and accessed.</p> <p>To enable access to the secure access port, APPROTECT must be unprotected. See also <a href="#">Application core access port protection for secure debug access</a> on page 817.</p> <p>For more information about the SPIDEN signal, see the <i>Arm CoreSight SoC-400 Technical Reference Manual, Revision r3p2</i>.</p> |
| UICR.ERASEPROTECT and CTRL-AP.ERASEPROTECT.DISABLE       | Disables the application core CTRL-AP.ERASEALL and NVMC ERASEALL functionality. This can be used together with APPROTECT to provide read-back and re-purposing protection.                                                                                                                                                                                                                                                                                                                                                                                          |

Table 86: Application core access port protection overview

| Registers                                    | Description                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UICR.APPROTECT and CTRL-AP.APPROTECT.DISABLE | <p>These registers control the generation of the network core AHB-AP DBGEN signal, which blocks all access through the network core AHB-AP. See also <a href="#">Network core access port protection for debug access</a> on page 817.</p> <p>For the network core that does not feature TrustZone, only DBGEN can be controlled and SPIDEN is not used.</p> |
| UICR.ERASEPROTECT                            | Disables the network core CTRL-AP.ERASEALL and NVMC ERASEALL functionality. This can be used together with APPROTECT to provide read-back and re-purposing protection.                                                                                                                                                                                       |

Table 87: Network core access port protection overview

For both cores, UICR and CTRL-AP are combined to enable or disable the access port protection. The access port is normally protected, and is opened when the following conditions are met:

1. UICR.APPROTECT must be Unprotected.
2. CTRL-AP.APPROTECT.DISABLE on both CPU and debugger side must match. However, after reset the debugger side register value is known and CPU can open the port by writing Unprotected to the register.

The following tables lists the available APPROTECT combinations.

| Application core<br>UICR.APPROTECT | CPU and debugger<br>side CTRL-<br>AP.APPROTECT.DISABLE<br>registers are equal | DBGEN | Debug access to<br>application core AHB-AP |
|------------------------------------|-------------------------------------------------------------------------------|-------|--------------------------------------------|
| Protected                          | No                                                                            | 0     | Not permitted                              |
| Protected                          | Yes                                                                           | 0     | Not permitted                              |
| Unprotected                        | No                                                                            | 0     | Not permitted                              |
| Unprotected                        | Yes                                                                           | 1     | Permitted                                  |

Table 88: Application core access port protection for non-secure debug access

| Application core<br>UICR.SECUREAPPROTECT | CPU and debugger side<br>CTRL-AP.SECUREAP-<br>PROTECT.DISABLE registers<br>are equal | SPIDEN | Secure debug access to<br>application core AHB-AP |
|------------------------------------------|--------------------------------------------------------------------------------------|--------|---------------------------------------------------|
| Protected                                | No                                                                                   | 0      | Not permitted                                     |
| Protected                                | Yes                                                                                  | 0      | Not permitted                                     |
| Unprotected                              | No                                                                                   | 0      | Not permitted                                     |
| Unprotected                              | Yes                                                                                  | 1      | Permitted                                         |

Table 89: Application core access port protection for secure debug access

| Network core UICR.AP-<br>PROTECT | CPU and debugger side CTRL-<br>AP.APPROTECT registers are<br>equal | DBGEN | Debug access to AHB-AP |
|----------------------------------|--------------------------------------------------------------------|-------|------------------------|
| Protected                        | No                                                                 | 0     | Not permitted          |
| Protected                        | Yes                                                                | 0     | Not permitted          |
| Unprotected                      | No                                                                 | 0     | Not permitted          |
| Unprotected                      | Yes                                                                | 1     | Permitted              |

Table 90: Network core access port protection for debug access

The access port is also open after the completion of the CTRL-AP.ERASEALL operation. After completing the erase operation, CTRL-AP will temporarily unprotect AHB-AP. AHB-AP will be protected when one of the following conditions are met:

- Power-on reset
- Brown-out reset
- Watchdog timer reset
- Pin reset

The following figure is an example on how nRF5340 with access port protection enabled can be erased, programmed, and configured to allow debugging. Operations sent from debugger as well as registers written by firmware will affect the access port state. The operation named Reset\* is one of the conditions listed above.

Figure 252: Access port unlocking

The debugger can read the access port protection status in the core's AHB-AP Control/Status Word register (CSW), defined in the *Arm CoreSight SoC-400 Technical Reference Manual, Revision r3p2*. The `DbgStatus` field indicates that the AHB-AP can perform AHB transfers, while the `SPIStatus` field indicates if secure AHB transfers are permitted. For a list of all debug access ports, see [DAP — Debug access port](#) on page 814.

For more details on `CTRLAP.ERASEALL`, `CTRLAP.SECUREAPPROTECT`, and `CTRLAP.APPROTECT`, see [CTRL-AP - Control access port](#) on page 826.

**Note:** Using [SPU — System protection unit](#) on page 651, the application core can be configured to grant the network core access to its resources. This grant also applies to the network core AHB-AP.

## 8.3 Debug Interface mode

Before the external debugger can use any of the access ports, the debugger must first request the device to power up via `CxxxPWRUPREQ` in the `SWJ-DP`.

As long as the debugger is requesting power via `CxxxPWRUPREQ`, the device will be in Debug interface mode. Otherwise, the device is in Normal mode. When a debug session is over, the external debugger must return the device back to Normal mode and perform a pin reset. This is due to the overall power consumption being higher in Debug interface mode compared to Normal mode.

Some peripherals behave differently in Debug interface mode compared to Normal mode. These differences are described in more detail in the chapters of the affected peripherals.

For details on how to use the debug capabilities, read the debug documentation of your IDE.

If the device is in System OFF when power is requested via `CxxxPWRUPREQ`, the device will wake up and the `DIF` flag in [RESETREAS](#) on page 70 will be set.

## 8.4 Real-time debug

The device supports real-time debugging, which allows interrupts to execute to completion in real time when breakpoints are set in Thread mode or lower priority interrupts.

Real-time debugging enables breakpoint setting and single-stepping through code without causing the failure of real-time event-driven threads running at higher priority. For example, this enables the device to

continue to service the high-priority interrupts of an external controller or sensor without failure or loss of state synchronization while stepping through code in a low-priority thread.

## 8.5 ROM tables

Each ROM Table on the SoC contains a listing of the components that are connected to the debug port or AHB-AP. These listings allow an external debugger or on-chip software to discover the CoreSight devices on the SoC.

Figure 253: Application core ROM table overview

| Address    | Component | Value       |
|------------|-----------|-------------|
| 0xE00FEFFC | CIDR3     | 0x000000B1  |

Table 94: Network Arm Cortex-M33 ROM table entries

## 8.6 Cross-trigger network

The debug system has a cross-trigger network used to simultaneously start and halt the cores in the system.

The following diagram shows an overview of the cross-trigger connections.

Figure 255: Cross-trigger network block diagram

Both the application and network cores have a cross-trigger interface (CTI) peripheral that can trigger events or be triggered by signals in the processor or debug blocks. The CTI can be configured to route trigger in-signals to trigger out-signals within the CTI or the cross-trigger matrix. The cross-trigger matrix has four channels in total that can be used to communicate trigger signals between cores.

You can stop the network core when the application core is stopped (due to a breakpoint or a stopped debug session), by doing the following:

1. Configure the application core CTI to generate an event on channel 0 for CTITRIGIN[0] (processor halted) using [CTIINEN\[0\]](#).
2. Configure the network core CTI to trigger CTITRIGOUT[0] (processor debug request) on channel 0 using [CTIOUTEN\[0\]](#).

## Configuring the cross-trigger interface

In this example, the following CTI channels are used:

- Channel 0 is used to relay debug requests from the application to the network domain.
- Channel 1 is used to relay debug requests from the network to the application domain.
- Channel 2 is used by the debugger to send a common trigger for restarting both domains after a breakpoint.

For the application core, add the following code:

```
#define CTI_TRIGIN_CPUHALTED    0
#define CTI_TRIGOUT_DEBUGREQ    0
#define CTI_TRIGOUT_CPURESTART 1
...
// Enable global CTI routing
NRF_CTI_S->CTICONTROL = CTI_CTICONTROL_GLBEN_Enabled;
// Connect the CPU halted trigger of this domain to debug request of the other domain
NRF_CTI_S->CTIINEN[CTI_TRIGIN_CPUHALTED]    = CTI_CTIINEN_TRIGINEN_0_Msk;
NRF_CTI_S->CTIOUTEN[CTI_TRIGOUT_DEBUGREQ]    = CTI_CTIOUTEN_TRIGOUTEN_1_Msk;
NRF_CTI_S->CTIOUTEN[CTI_TRIGOUT_CPURESTART] = CTI_CTIOUTEN_TRIGOUTEN_2_Msk;
```

For the network core, add the following code:

```
#define CTI_TRIGIN_CPUHALTED    0
#define CTI_TRIGOUT_DEBUGREQ    0
#define CTI_TRIGOUT_CPURESTART 1
...
// Enable global CTI routing
NRF_CTI_NS->CTICONTROL = CTI_CTICONTROL_GLBEN_Enabled;
// Connect the CPU halted trigger of this domain to debug request of the other domain
NRF_CTI_NS->CTIINEN[CTI_TRIGIN_CPUHALTED]    = CTI_CTIINEN_TRIGINEN_1_Msk;
NRF_CTI_NS->CTIOUTEN[CTI_TRIGOUT_DEBUGREQ]    = CTI_CTIOUTEN_TRIGOUTEN_0_Msk;
NRF_CTI_NS->CTIOUTEN[CTI_TRIGOUT_CPURESTART] = CTI_CTIOUTEN_TRIGOUTEN_2_Msk;
```

See the following tables for more information about trigger connections to and from the CTI.

| Signal       | Description             |
|--------------|-------------------------|
| CTITRIGIN[0] | Processor halted        |
| CTITRIGIN[1] | DWT comparator output 0 |
| CTITRIGIN[2] | DWT comparator output 1 |
| CTITRIGIN[3] | DWT comparator output 2 |
| CTITRIGIN[4] | ETM event output 0      |
| CTITRIGIN[5] | ETM event output 1      |

## 8.7 Multidrop serial wire debug

Multidrop serial wire debug allows simultaneous access to an unlimited number of devices through a single connection. This is useful for connectivity-constrained products that contain multiple chips with multidrop support.

In order to select a target in a multidrop capable product, the debugger must write the correct TINSTANCE, TPARTNO, and TDESIGNER fields into the SW-DP TARGETSEL register. The values for these fields are located in and fetched from two registers, [TARGETID](#) on page 814 and [DLPIDR](#) on page 815.

For more information about multidrop SWD, see *Arm Debug Interface Architecture Specification*, ADIV5.0 to ADIV5.2.

## 8.8 Trace

The device supports ETM and ITM trace.

Trace data from the ETM and the ITM is sent to an external debugger via a 4-bit wide parallel trace port (TPIU) on pins **TRACEDATA0** through **TRACEDATA3** and **TRACECLK**.

In addition to parallel trace, the TPIU supports serial trace via the serial wire output (SWO) trace protocol. Parallel and serial trace cannot be used at the same time. ETM trace is supported in Parallel trace mode only, while both parallel and Serial trace modes support the ITM trace. For details on how to use the trace capabilities, see the debug documentation of your IDE.

TPIU's dedicated trace pins are multiplexed with GPIOs. **SWO** and **TRACEDATA0** use the same GPIO. Trace is limited to dedicated pins. See [Pin assignments](#) on page 851 for more information.

Trace speed is configured in the register **TRACEPORTSPEED (Retained)** on page 850. The speed of the trace pins depends on the drive setting of the GPIOs that the trace pins are multiplexed with. The drive setting is configured using the **DRIVE** field of the GPIO register **PIN\_CNF[n] (n=0..31) (Retained)** on page 302.

Only drive settings **S0S1**, **H0H1**, and **E0E1** should be used for debugging. **S0S1** is the default drive at reset. If parallel or serial trace port signals are not fast enough in the debugging conditions, all GPIOs in use for tracing should be set to high drive (**H0H1**), or extra high drive (**E0E1**) for the fastest trace port speeds. Ensure that the drive setting of the GPIOs are not overwritten by software during the debugging session.

In addition to **DRIVE**, the GPIO pin must be assigned to trace and debug (**TND**), using the **MCUSEL** field of the **PIN\_CNF** register. When pins are assigned to **TND**, these GPIOs are output-only, and other functionality of the pins is disabled.

## 8.9 Enabling the trace port

A specific sequence of operations must be performed to enable the trace port.

1. Enable the debug master.

```
NRF_TAD_S->ENABLE = TAD_ENABLE_ENABLE_Msk;
```

2. Request clock startup.

```
NRF_TAD_S->CLOCKSTART = TAD_CLOCKSTART_START_Msk;
```

3. Configure the trace port to use pins P0.08 through P0.12.

```
NRF_TAD_S->PSEL.TRACECLK = TAD_PSEL_TRACECLK_PIN_Traceclk;
NRF_TAD_S->PSEL.TRACEDATA0 = TAD_PSEL_TRACEDATA0_PIN_Tracedata0;
NRF_TAD_S->PSEL.TRACEDATA1 = TAD_PSEL_TRACEDATA1_PIN_Tracedata1;
NRF_TAD_S->PSEL.TRACEDATA2 = TAD_PSEL_TRACEDATA2_PIN_Tracedata2;
NRF_TAD_S->PSEL.TRACEDATA3 = TAD_PSEL_TRACEDATA3_PIN_Tracedata3;
```

4. Configure the GPIO pins so that the trace and debug system can control them. Set high drive strength to ensure sufficiently fast operation. Do this for all trace pins that should be used.

```
// Clear the bitfields before configuring to make sure the correct value is written
NRF_P0_S->PIN_CNF[TAD_PSEL_TRACECLK_PIN_Traceclk]
    &= ~(GPIO_PIN_CNF_MCUSEL_Msk | GPIO_PIN_CNF_DRIVE_Msk);
NRF_P0_S->PIN_CNF[TAD_PSEL_TRACECLK_PIN_Traceclk]
    |= (GPIO_PIN_CNF_MCUSEL_TND << GPIO_PIN_CNF_MCUSEL_Pos)
    | (GPIO_PIN_CNF_DRIVE_E0E1 << GPIO_PIN_CNF_DRIVE_Pos);
```

5. Set trace port speed to 64 MHz.

```
NRF_TAD_S->TRACEPORTSPEED = TAD_TRACEPORTSPEED_TRACEPORTSPEED_64MHz;
```

**Note:** Although possible, it is not recommended to run the trace port at less than half the CPU frequency, as it risks dropping some trace packets.

6. Configure Arm CoreSight components (see Arm CoreSight documentation for more information).

## 8.10 CTRL-AP - Control access port

The control access port (CTRL-AP) is a custom access port that enables control of the device when other debug access ports (DAP) have been disabled by the access port protection.

For an overview of the other debug access ports, see [DAP — Debug access port](#) on page 814.

Figure 256: Control access port details

Access port protection (APPROTECT) blocks the debugger access to the AHB-AP, and prevents read and write access to all CPU registers and memory-mapped addresses. To enable port protection access for both secure and non-secure modes, use the registers `UICR.SECUREAPPROTECT` and `UICR.APPROTECT`, as well as `CTRLAP.APPROTECT.DISABLE` and `CTRLAP.SECUREAPPROTECT.DISABLE`. The debugger can use the register to read the status of secure and non-secure access port protection.

Erase protection (ERASEPROTECT) protects the flash and UICR parts of the non-volatile memory from being erased. Erase protection can be temporarily disabled from the control access port.

CTRL-AP has the following features:

- Soft reset

- Erase all
- Mailbox interface
- Debug of protected devices

### 8.10.1 Reset request

The debugger can request the device to perform a soft reset.

Use the register [RESET](#) on page 830 to request a soft reset. Once the soft reset is performed, the reset reason is accessible on the on-chip firmware through the RESETRAS register. For more information about the soft reset, see [RESET — Reset control](#) on page 65.

### 8.10.2 Erase all

The erase all function lets the debugger trigger an erase of flash, user information configuration registers (UICR), RAM, all peripheral settings, and also temporarily removes the access port protection.

To trigger an erase all function, the debugger writes to the register [ERASEALL](#) on page 830. The register [ERASEALLSTATUS](#) on page 830 will read as busy for the duration of the operation. The ERASEALL mechanism completes its tasks by writing UICR.APPROTECT to the `Unprotected` value, in addition to writing the CPU side [CTRLAP.SECUREAPPROTECT.DISABLE](#) and [CTRLAP.APPROTECT.DISABLE](#) registers to the value `0x50FA50FA`. After the next soft reset, the access port protection is temporarily removed. This temporary unprotection is removed by the next pin reset, power-on reset, brown-out reset, or watchdog timer reset. For more information about access port protection, see [Access port protection](#) on page 815.

If the debugger performs an erase all function on a slave MCU, the erase sequence will always erase the application MCU first, independently of how the application is protected, before erasing the slave MCU.

#### Erase all protection

It is possible to prevent the debugger from performing an erase all operation by writing to the UICR.ERASEPROTECT register. Once the register is configured and the device is reset, the CTRL-AP [ERASEALL](#) operation is disabled, and all flash write and erase operations are restricted to the firmware. In addition, it is still possible to write/erase from the debugger as long as the UICR.APPROTECT register is not set.

**Note:** Setting the UICR.ERASEPROTECT register only affects the erase all operation and not the debugger access.

The register [ERASEPROTECT.STATUS](#) on page 831 holds the status for erase protection.

### 8.10.3 Mailbox interface

CTRL-AP implements a mailbox interface which enables the CPU to communicate with a debugger over the SWD interface.

The mailbox interface consists of a transmit register [MAILBOX.TXDATA](#) on page 832 with its corresponding status register [MAILBOX.TXSTATUS](#) on page 832, and a receive register [MAILBOX.RXDATA](#) on page 832 with its corresponding status register [MAILBOX.RXSTATUS](#) on page 833. Status bits in the TXSTATUS/RXSTATUS registers are set and cleared automatically when the TXDATA/RXDATA registers are written to and read from, independently of the direction.

Figure 257: Mailbox register interface

### Mailbox transfer sequence

1. Sender writes TXDATA.
2. Hardware sets sender's TXSTATUS to DataPending.
3. Hardware sets receiver's RXSTATUS to DataPending.
4. Receiver reads RXDATA.
5. Hardware sets receiver's RXSTATUS to NoDataPending.
6. Hardware sets sender's TXSTATUS to NoDataPending.

#### 8.10.4 Disabling erase protection

The erase protection mechanism can be disabled to return a device to factory default settings on next reset.

The debugger can read the erase protection status in the register [ERASEPROTECT.STATUS](#) on page 831.

If ERASEPROTECT has been enabled, both the debugger and on-chip firmware must write the same non-zero 32-bit KEY value into their respective ERASEPROTECT.DISABLE registers to disable the erase protection. When both registers have been written with the same non-zero 32-bit KEY value, the device is automatically erased as described in [Erase all](#) on page 827. The access ports will be re-enabled on the next reset once the secure erase sequence has completed.

The write-once register [ERASEPROTECT.LOCK](#) on page 835 should be set to `Locked` as early as possible in the start-up sequence, preferably as soon as the on-chip firmware has determined it does not need to communicate with a debugger over the CTRL-AP mailbox interface. Once written, it will not be possible to remove the erase protection until the next reset.

#### 8.10.5 Disabling access port protection

The access port protection mechanisms can be temporarily disabled to debug the device.

The disabling of the access port protection is done through a combination of UICR and CTRL-AP registers.

### Disabling non-secure access port protection

If UICR.APPROTECT has been enabled from UICR, the device access port is protected.

If UICR.APPROTECT has not been enabled from UICR, both the debugger and on-chip firmware must write the same non-zero 32-bit KEY value into their respective registers [CTRLAP.APPROTECT.DISABLE](#) (CPU-side) and [CTRLAP.APPROTECT.DISABLE](#) (debugger-side) to disable the access port protection to non-secure mode.

The write-once register [APPROTECT.LOCK](#) on page 836 should be set to `Locked` as early as possible in the start-up sequence. Once written, it will not be possible to remove the non-secure mode access port protection until next reset.

## Disabling secure access port protection

If `UICR.APPROTECT` has been enabled from `UICR`, the device access port is protected.

If `UICR.SECUREAPPROTECT` has not been enabled from `UICR`, both the debugger and on-chip firmware must write the same non-zero 32-bit `KEY` value into their respective registers [CTRLAP.SECUREAPPROTECT.DISABLE](#) (CPU-side) and [CTRLAP.SECUREAPPROTECT.DISABLE](#) (debugger-side) to disable the access port protection to secure mode.

The write-once register [SECUREAPPROTECT.LOCK](#) on page 836 should be set to `Locked` as early as possible in the start-up sequence, preferably as soon as on-chip firmware has determined it does not need to communicate with a debugger over the CTRL-AP mailbox interface. Once written, it will not be possible to remove the secure mode access port protection until next reset.

**Note:** If secure mode debug is enabled, an `ERASEALL` sequence can also be initiated by writing the same 32-bit `KEY` value into the respective `ERASEPROTECT.DISABLE` registers

The [CTRLAP.APPROTECT.DISABLE](#) and [CTRLAP.SECUREAPPROTECT.DISABLE](#) registers are only reset by pin reset, brown-out reset, or watchdog timer reset. This allows keeping the debug session active through soft resets.

After an `ERASEALL` sequence has completed, the access port protection of the core's AHB-AP is disabled until the next pin reset, power-on reset, brown-out reset, or watchdog timer reset. This will allow initial firmware to be written. For more details on `ERASEALL`, see [Erase all](#) on page 827.

## Access port protection status

The debugger can read the access port protection status in the core's AHB-AP, using the Arm AHB-AP Control/Status Word register (CSW), defined in the *Arm CoreSight SoC-400 Technical Reference Manual, Revision r3p2*. The `DbgStatus` field indicates that the AHB-AP can perform AHB transfers, while the `SPISStatus` indicates if secure AHB transfers are permitted. For a list of all debug access ports, see [DAP — Debug access port](#) on page 814.

## 8.10.6 Debugger registers

CTRL-AP has a set of registers that can only be accessed from the debugger over the SWD interface. These are not accessible from the CPU.

The `SECUREAPPROTECT` fields and registers only apply for cores that have the Arm Cortex-M33 with TrustZone technology.

### 8.10.6.1 Debug side registers

#### Register overview

| Register                                | Offset | TZ | Description                                                                                                                                                                         |
|-----------------------------------------|--------|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">RESET</a>                   | 0x000  |    | System reset request.                                                                                                                                                               |
| <a href="#">ERASEALL</a>                | 0x004  |    | Perform a secure erase of the device, where flash, SRAM, and <code>UICR</code> will be erased in sequence. The device will be returned to factory default settings upon next reset. |
| <a href="#">ERASEALLSTATUS</a>          | 0x008  |    | This is the status register for the <code>ERASEALL</code> operation.                                                                                                                |
| <a href="#">APPROTECT.DISABLE</a>       | 0x010  |    | This register disables <code>APPROTECT</code> and enables debug access to non-secure mode.                                                                                          |
| <a href="#">SECUREAPPROTECT.DISABLE</a> | 0x014  |    | This register disables <code>SECUREAPPROTECT</code> and enables debug access to secure mode.                                                                                        |

| Register             | Offset | TZ | Description                                                                                          |
|----------------------|--------|----|------------------------------------------------------------------------------------------------------|
| ERASEPROTECT.STATUS  | 0x018  |    | This is the status register for the UICR ERASEPROTECT configuration.                                 |
| ERASEPROTECT.DISABLE | 0x01C  |    | This register disables ERASEPROTECT and performs ERASEALL.                                           |
| MAILBOX.TXDATA       | 0x020  |    | Data sent from the debugger to the CPU.                                                              |
| MAILBOX.TXSTATUS     | 0x024  |    | This register shows a status that indicates if data sent from the debugger to the CPU has been read. |
| MAILBOX.RXDATA       | 0x028  |    | Data sent from the CPU to the debugger.                                                              |
| MAILBOX.RXSTATUS     | 0x02C  |    | This register shows a status that indicates if data sent from the CPU to the debugger has been read. |
| IDR                  | 0x0FC  |    | CTRL-AP Identification Register, IDR.                                                                |

### 8.10.6.1.1 RESET

Address offset: 0x000

System reset request.

This register is automatically deactivated during an ERASEALL operation.

### 8.10.6.1.2 ERASEALL

Address offset: 0x004

Perform a secure erase of the device, where flash, SRAM, and UICR will be erased in sequence. The device will be returned to factory default settings upon next reset.

|                  |     |          |             |       |                                           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |  |

A R PALL Status bit for erase protection

**Note:** The reset value is auto read from the ERASEPROTECT register in UICR.

|          |   |                                                           |
|----------|---|-----------------------------------------------------------|
| Enabled  | 0 | ERASEPROTECT is enabled                                   |
| Disabled | 1 | ERASEPROTECT is not enabled and ERASEALL can be performed |

### 8.10.6.1.7 ERASEPROTECT.DISABLE

Address offset: 0x01C

This register disables ERASEPROTECT and performs ERASEALL.

A RW1 KEY The ERASEALL sequence will be initiated if value of the KEY fields are non-zero and the KEY fields match on both the CPU and debugger sides.

### 8.10.6.1.8 MAILBOX.TXDATA

Address offset: 0x020

Data sent from the debugger to the CPU.

Writing to this register will automatically set a DataPending value in the TXSTATUS register.

A RW Data Data sent from debugger

### 8.10.6.1.9 MAILBOX.TXSTATUS

Address offset: 0x024

This register shows a status that indicates if data sent from the debugger to the CPU has been read.

### 8.10.6.1.10 MAILBOX.RXDATA

Address offset: 0x028

Data sent from the CPU to the debugger.

Reading from this register will automatically set a NoDataPending value in the RXSTATUS register.

## 8.10.7 Registers

### Instances

| Instance    | Domain      | Base address | TrustZone |     |     | Split access | Description                  |
|-------------|-------------|--------------|-----------|-----|-----|--------------|------------------------------|
|             |             |              | Map       | Att | DMA |              |                              |
| CTRLAP : S  | APPLICATION | 0x50006000   | US        | S   | NSA | No           | Control access port CPU side |
| CTRLAP : NS |             | 0x40006000   |           |     |     |              |                              |
| CTRLAP      | NETWORK     | 0x41006000   | HF        | NS  | NA  | No           | Control access port CPU side |

## Configuration

| Instance                  | Domain      | Configuration                                                                                      |
|---------------------------|-------------|----------------------------------------------------------------------------------------------------|
| CTRLAP : S<br>CTRLAP : NS | APPLICATION |                                                                                                    |
| CTRLAP                    | NETWORK     | SECUREAPPROTECT.LOCK, SECUREAPPROTECT.DISABLE, and STATUS.SECUREAPPROTECT registers not supported. |

## Register overview

| Register                | Offset | TZ | Description                                                                                              |
|-------------------------|--------|----|----------------------------------------------------------------------------------------------------------|
| MAILBOX.RXDATA          | 0x400  |    | Data sent from the debugger to the CPU.                                                                  |
| MAILBOX.RXSTATUS        | 0x404  |    | This register shows a status that indicates if data sent from the debugger to the CPU has been read.     |
| MAILBOX.TXDATA          | 0x480  |    | Data sent from the CPU to the debugger.                                                                  |
| MAILBOX.TXSTATUS        | 0x484  |    | This register shows a status that indicates if the data sent from the CPU to the debugger has been read. |
| ERASEPROTECT.LOCK       | 0x500  |    | This register locks the ERASEPROTECT.DISABLE register from being written until next reset.               |
| ERASEPROTECT.DISABLE    | 0x504  |    | This register disables the ERASEPROTECT register and performs an ERASEALL operation.                     |
| APPROTECT.LOCK          | 0x540  |    | This register locks the APPROTECT.DISABLE register from being written to until next reset.               |
| APPROTECT.DISABLE       | 0x544  |    | This register disables the APPROTECT register and enables debug access to non-secure mode.               |
| SECUREAPPROTECT.LOCK    | 0x548  |    | This register locks the SECUREAPPROTECT.DISABLE register from being written until next reset.            |
| SECUREAPPROTECT.DISABLE | 0x54C  |    | This register disables the SECUREAPPROTECT register and enables debug access to secure mode.             |
| STATUS                  | 0x600  |    | Status bits for CTRL-AP peripheral.                                                                      |

### 8.10.7.1 MAILBOX.RXDATA

Address offset: 0x400

Data sent from the debugger to the CPU.

Reading from this register will automatically set a NoDataPending value in the RXSTATUS register.

|                  |     |        |          |       |                                                                                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 8.10.7.2 MAILBOX.RXSTATUS

Address offset: 0x404

This register shows a status that indicates if data sent from the debugger to the CPU has been read.

|                  |     |          |               |                                                                                       |                                    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 8.10.7.3 MAILBOX.TXDATA

Address offset: 0x480

Data sent from the CPU to the debugger.

Writing to this register will automatically set a DataPending value in the TXSTATUS register.

|                  |     |        |          |       |    |    |    |                       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

### 8.10.7.4 MAILBOX.TXSTATUS

Address offset: 0x484

This register shows a status that indicates if the data sent from the CPU to the debugger has been read.

|                  |     |          |               |       |                                    |                                   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |  |

### 8.10.7.9 SECUREAPPROTECT.LOCK

Address offset: 0x548

This register locks the SECUREAPPROTECT.DISABLE register from being written until next reset.

### 8.10.7.10 SECUREAPPROTECT.DISABLE

Address offset: 0x54C

This register disables the SECUREAPPROTECT register and enables debug access to secure mode.

## 8.11 CTI - Cross Trigger Interface

Configuration interface for the Cross Trigger Interface

Please refer to the [CTI](#) section for more information about how to configure the Cross Trigger Interface.

### 8.11.1 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description             |
|----------|-------------|--------------|-----------|-----|-----|--------------|-------------------------|
|          |             |              | Map       | Att | DMA |              |                         |
| CTI      | APPLICATION | 0xE0042000   | HF        | S   | NA  | No           | Cross-trigger interface |
| CTI      | NETWORK     | 0xE0042000   | HF        | NS  | NA  | No           | Cross-trigger interface |

## Configuration

| Instance | Domain      | Configuration                                                                                                              |
|----------|-------------|----------------------------------------------------------------------------------------------------------------------------|
| CTI      | APPLICATION |                                                                                                                            |
| CTI      | NETWORK     | ETMEVTIN and ETMEVTOUT fields are not supported, as the embedded trace macrocell (ETM) is not present in the network core. |

## Register overview

| Register         | Offset | TZ | Description                            |
|------------------|--------|----|----------------------------------------|
| CTICONTROL       | 0x000  |    | CTI Control register                   |
| CTIINTACK        | 0x010  |    | CTI Interrupt Acknowledge register     |
| CTIAPPSET        | 0x014  |    | CTI Application Trigger Set register   |
| CTIAPPCLEAR      | 0x018  |    | CTI Application Trigger Clear register |
| CTIAPPULSE       | 0x01C  |    | CTI Application Pulse register         |
| CTIINEN[n]       | 0x020  |    | CTI Trigger to Channel Enable register |
| CTIOUTEN[n]      | 0x0A0  |    | CTI Channel to Trigger Enable register |
| CTITRIGINSTATUS  | 0x130  |    | CTI Trigger In Status register         |
| CTITRIGOUTSTATUS | 0x134  |    | CTI Trigger Out Status register        |
| CTICHINSTATUS    | 0x138  |    | CTI Channel In Status register         |
| CTIGATE          | 0x140  |    | Enable CTI Channel Gate register       |
| DEVARCH          | 0xFBC  |    | Device Architecture register           |
| DEVID            | 0xFC8  |    | Device Configuration register          |
| DEVTYPE          | 0xFCC  |    | Device Type Identifier register        |
| PIDR4            | 0xFD0  |    | Peripheral ID4 Register                |
| PIDR5            | 0xFD4  |    | Peripheral ID5 register                |
| PIDR6            | 0xFD8  |    | Peripheral ID6 register                |
| PIDR7            | 0xFDC  |    | Peripheral ID7 register                |
| PIDR0            | 0xFE0  |    | Peripheral ID0 Register                |
| PIDR1            | 0xFE4  |    | Peripheral ID1 Register                |
| PIDR2            | 0xFE8  |    | Peripheral ID2 Register                |

| CIDR0            | 0xFF0  |    | Component ID0 Register                 |
| CIDR1            | 0xFF4  |    | Component ID1 Register                 |
| CIDR2            | 0xFF8  |    | Component ID2 Register                 |
| CIDR3            | 0xFFC  |    | Component ID3 Register                 |

### 8.11.1.1 CTICONTROL

Address offset: 0x000

CTI Control register

The CTICONTROL register enables the CTI.

### 8.11.1.2 CTIINTACK

Address offset: 0x010

CTI Interrupt Acknowledge register

The CTIINTACK register is a software acknowledge for a trigger output. This register is used when cttrigout is used as a sticky output. That is, no hardware acknowledge is available and a software acknowledge is required.

### 8.11.1.5 CTIAPPULSE

Address offset: 0x01C

CTI Application Pulse register

A write to this register causes a channel event pulse of one ctclk period to be generated. This corresponds to the bit that was written to. The pulse external to the CTI can be extended to multi-cycle by the

handshaking interface circuits. This register clears itself immediately, so it can be repeatedly written to without software having to clear it.

### 8.11.1.6 CTIINEN[n] (n=0..7)

Address offset: 0x020 + (n × 0x4)

CTI Trigger to Channel Enable register

The CTIINENn register enables the signaling of an event on CTM channels when a trigger event is received by the CTI. There is a bit for each of the four channels implemented. This register does not affect the application trigger operations.

### 8.11.1.7 CTIOUTEN[n] (n=0..7)

Address offset: 0x0A0 + (n × 0x4)

CTI Channel to Trigger Enable register

The CTIOUTENn register defines which channels can generate a ctitrigin[n] output. There is a bit for each of the four channels implemented. This register affects the mapping from application trigger to trigger outputs.

### 8.11.1.11 CTIGATE

Address offset: 0x140

Enable CTI Channel Gate register

The CTIGATE register prevents the channels from propagating through the CTM to other CTIs. This enables local cross-triggering (e.g. causing an interrupt when the ETM trigger occurs). It can be used effectively with CTIAPPSET, CTIAPPCLEAR, and CTIAPPPULSE for asserting trigger outputs by asserting channels, without affecting the rest of the system. On reset, this register is 0xF and channel propagation is enabled.

### 8.11.1.14 DEVTYPE

Address offset: 0xFCC

Device Type Identifier register

The DEVTYPE register provides a debugger with information about the component when the Part Number field is not recognized. The debugger can then report this information.

### 8.11.1.15 PIDR4

Address offset: 0xFD0

Peripheral ID4 Register

The PIDR4 register is part of the set of peripheral identification registers. It contains part of the designer identity and the memory size.

### 8.11.1.22 PIDR3

Address offset: 0xFEC

Peripheral ID3 Register

The PIDR3 register is part of the set of peripheral identification registers. It contains the REVAND and CMOD fields.

| Bit number       |     |        |            | 31    | 30                                                                                                                                                                                                                                                                                                                                           | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| A                | R   | CMOD   |            |       | Customer Modified. Indicates whether the customer has modified the behavior of the component. In most cases, this field is 0b0000. Customers change this value when they make authorized modifications to this component.                                                                                                                    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|                  |     |        | Unmodified | 0     | Indicates that the customer has not modified this component.                                                                                                                                                                                                                                                                                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| B                | R   | REVAND |            |       | Indicates minor errata fixes specific to the revision of the component being used, for example metal fixes after implementation. In most cases, this field is 0b0000. Arm recommends that the component designers ensure that a metal fix can change this field if required, for example, by driving it from registers that reset to 0b0000. |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|                  |     |        | NoErrata   | 0     | Indicates that there are no errata fixes to this component.                                                                                                                                                                                                                                                                                  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

### 8.11.1.23 CIDR0

Address offset: 0xFF0

Component ID0 Register

The CIDR0 register is a component identification register that indicates the presence of identification registers.

### 8.11.1.24 CIDR1

Address offset: 0xFF4

Component ID1 Register

The CIDR1 register is a component identification register that indicates the presence of identification registers. This register also indicates the component class.

### 8.11.1.25 CIDR2

Address offset: 0xFF8

Component ID2 Register

The CIDR2 register is a component identification register that indicates the presence of identification registers.

## 8.12 TAD - Trace and debug control

Configuration interface for trace and debug

Please refer to the [Trace](#) section for more information about how to configure the trace and debug interface.

**Note:** Although there are [PSEL](#) registers for the trace port, each function can only be mapped to a single pin due to pin speed requirements. Setting the PIN field to anything else will not have any effect. See [Pin assignment chapter](#) for more information

## 8.12.1 Registers

### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description             |
|----------|-------------|--------------|-----------|-----|-----|--------------|-------------------------|
|          |             |              | Map       | Att | DMA |              |                         |
| TAD      | APPLICATION | 0xE0080000   | HF        | S   | NA  | No           | Trace and debug control |

### Register overview

| Register        | Offset | TZ | Description                                         |
|-----------------|--------|----|-----------------------------------------------------|
| CLOCKSTART      | 0x004  |    | Start all trace and debug clocks.                   |
| CLOCKSTOP       | 0x008  |    | Stop all trace and debug clocks.                    |
| ENABLE          | 0x500  |    | Enable debug domain and acquire selected GPIOs      |
| PSEL.TRACECLK   | 0x504  |    | Pin configuration for TRACECLK                      |
| PSEL.TRACEDATA0 | 0x508  |    | Pin configuration for TRACEDATA[0]                  |
| PSEL.TRACEDATA1 | 0x50C  |    | Pin configuration for TRACEDATA[1]                  |
| PSEL.TRACEDATA2 | 0x510  |    | Pin configuration for TRACEDATA[2]                  |
| PSEL.TRACEDATA3 | 0x514  |    | Pin configuration for TRACEDATA[3]                  |
| TRACEPORTSPEED  | 0x518  |    | Clocking options for the Trace Port debug interface |
|                 |        |    | Reset behavior is the same as debug components      |
|                 |        |    | This register is retained.                          |

#### 8.12.1.1 CLOCKSTART

Address offset: 0x004

Start all trace and debug clocks.

| Bit number       |     | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |          |       |             |                                   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

# 9 Hardware and layout

## 9.1 Pin assignments

This section describes the pin assignment and the pin functions.

This device provides flexibility when it comes to routing and configuration of the GPIO pins. However, some pins have recommendations for how the pin should be configured or what it should be used for.

In addition to the information in the pinout tables for the respective packages, the following peripherals have dedicated pins that should be used for proper operation:

- TWI - For the fastest TWI 1 Mbps mode, the two high-speed TWI pins must be configured in the TWI peripheral's PSEL registers, and the 20 mA open drain driver enabled using the E0E1 drive setting in the DRIVE field of the PIN\_CNF GPIO register.
- QSPI - For QSPI only the dedicated GPIO pins from the following table shall be used. These must be enabled using the Peripheral option of the PIN\_CNF[p].MCUSEL register. The GPIO must use the high drive H0H1 configuration in the DRIVE field of the PIN\_CNF GPIO register.
- SPIM4 - For the 32 Mbps SPI mode, the special purpose GPIO pins are enabled using the Peripheral option of the PIN\_CNF[p].MCUSEL register. When activated, the SPIM PSEL settings are ignored, and the dedicated pins are used. The GPIO must use the high drive H0H1 configuration in the DRIVE field of the PIN\_CNF GPIO register.
- TRACE - When using trace, the TRACEDATA[n] and TRACECLK GPIO pins must all use the extra high drive E0E1 configuration in the DRIVE field of the PIN\_CNF GPIO register. Also, the TND option of the PIN\_CNF[p].MCUSEL register must be used.

| GPIO pin        | Description                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| P0.08 - P0.12   | Drive configuration E0E1 is available and must be used for TRACE. For 32 Mbps high-speed SPI using SPIM4, drive configuration H0H1 must be used. |
| P0.13 - P0.18   | The H0H1 drive configuration features the highest speeds of quad SPI using the direct connection of the QSPI peripheral.                         |
| P1.02 and P1.03 | The E0E1 drive configuration activates a 20 mA open-drain driver specifically designed for high-speed TWI.                                       |
| Remaining pins  | The E0E1 drive configuration is not supported. Using the E0E1 drive configuration will cause incorrect operation.                                |

Table 99: Special GPIO considerations

**Note:** The extra high drive E0E1 drive configuration has limited availability. It is only available for the dedicated TRACE pins on P0.08 through P0.12. For the dedicated, high-speed TWIM pins on P1.02 and P1.03, the E0E1 drive configuration activates a powerful 20 mA *open-drain* driver specifically designed for high-speed TWI.

For all high-speed signals, the printed circuit board (PCB) layout must ensure that connections are made using short PCB traces. Refer to the manufacturer's PCB design recommendations for additional information.

### 9.1.1 aQFN94 pin assignments

The aQFN94 package has 94 pins in addition to four corner pads and a die pad.

Some pins are named N.C. (not connected). These pins can be left unconnected, or used as recommended in the pin assignments table.

Figure 258: aQFN pin assignments, top view. Corner and die pad is not illustrated.

| Pin | Name   | Function     | Description                           | Recommended usage |
|-----|--------|--------------|---------------------------------------|-------------------|
| A5  | VBUS   | Power        | 5 V input for USB 3.3 V regulator     |                   |
| A13 | DECA   | Power        | Analog regulator supply decoupling    |                   |
| A15 | DECD   | Power        | Digital regulator supply decoupling   |                   |
| A17 | P1.13  | Digital I/O  | General purpose I/O                   |                   |
| A19 | VDD    | Power        | Power supply                          |                   |
| A21 | DCC    | Power        | DC/DC converter output                |                   |
| A23 | DECN   | Power        | Regulator supply decoupling           |                   |
| A25 | N.C.   |              |                                       | Connect to VSS    |
| A27 | DECR   | Power        | Regulator supply decoupling           |                   |
| B2  | D+     | USB          | USB D+                                |                   |

| Die pad               | VSS           | Power                       | Ground pad. Exposed die pad must be connected to ground (VSS) for proper device operation. |                   |

Table 100: aQFN pin assignments

### 9.1.2 WLCSP pin assignments

This section describes the pin assignments for both the CLAA and CMAA package variants.

Figure 259: WLCSP pin assignments, top view

| Pin | Name   | Function     | Description                           | Recommended usage |
|-----|--------|--------------|---------------------------------------|-------------------|
| A1  | XC1    | Analog input | Connection for 32 MHz crystal         |                   |
| A2  | XC2    | Analog input | Connection for 32 MHz crystal         |                   |
| A3  | VDD    | Power        | Power supply                          |                   |
| A5  | VSS    | Power        | Ground                                |                   |
| A7  | DECD   | Power        | Regulator supply decoupling           |                   |
| A9  | DCCD   | Power        | DC/DC converter output                |                   |
| A11 | D-     | USB          | USB D-                                |                   |
| A12 | D+     | USB          | USB D+                                |                   |
| B1  | DECRF  | Power        | RADIO power supply decoupling         |                   |
| B2  | VSS    | Power        | Ground                                |                   |
| B4  | DECR   | Power        | Regulator supply decoupling           |                   |
| B5  | DECN   | Power        | Regulator supply decoupling           |                   |
| B6  | DCC    | Power        | DC/DC converter output                |                   |
| B7  | VDD    | Power        | Power supply                          |                   |
| B8  | DECA   | Power        | Regulator supply decoupling           |                   |
| B9  | VSS    | Power        | Ground                                |                   |
| B10 | VDD    | Power        | Power supply                          |                   |
| B11 | VBUS   | Power        | Power                                 |                   |
| B12 | VDDH   | Power        | Power supply                          |                   |
| C2  | VSS    | Power        | Ground                                |                   |

| Min. | 0.361 | 0.095 | 0.266 | 0.12 |       |       |      |     |      |       |        |
| Nom. | 0.404 |       | 0.294 |      | 4.390 | 3.994 | 3.85 | 3.5 | 0.35 | 1.683 | 1.9907 |
| Max. | 0.447 | 0.125 | 0.322 | 0.18 |       |       |      |     |      |       |        |

Table 103: CLAA WLCSP dimensions in millimeters

### 9.2.3 CMAA WLCSP package

Dimensions in millimeters for the CMAA WLCSP package.

Figure 262: CMAA WLCSP 4.4 x 4.0 mm package

|      | A     | A1   | A3    | b    | D     | E     | D2   | E2  | e    | K     | L      |
|------|-------|------|-------|------|-------|-------|------|-----|------|-------|--------|
| Min. | 0.406 | 0.14 | 0.266 | 0.19 |       |       |      |     |      |       |        |
| Nom. | 0.449 |      | 0.294 |      | 4.390 | 3.994 | 3.85 | 3.5 | 0.35 | 1.683 | 1.9907 |
| Max. | 0.492 | 0.17 | 0.322 | 0.25 |       |       |      |     |      |       |        |

Table 104: CMAA WLCSP dimensions in millimeters

## 9.3 Reference circuitry

To ensure good RF performance when designing PCBs, it is highly recommended to use the PCB layouts and component values provided by Nordic Semiconductor.

Documentation for the different package reference circuits, including Altium Designer files, PCB layout files, and PCB production files can be downloaded from [www.nordicsemi.com](http://www.nordicsemi.com).

In this section, there are reference circuits for QKAA aQFN94, CLAA WLCSP, and CMAA WLCSP, showing the components and component values to support on-chip features in a design.

Some general guidance is summarized here:

- External supply from VDD is only available when power is supplied to VDDH.
- When supplying power from a USB source only, VBUS pin must be connected to VDDH pin if USB is to be used.
- Components required for DC/DC function are only needed if DC/DC mode is enabled for that regulator.
- NFC can be used in any configuration.
- USB can be used in any configuration as long as VBUS is supplied by the USB host.
- The schematics include an optional, but recommended, series resistor on the USB supply for improved immunity to transient over-voltage during VBUS connection.

| Config no. | Supply configuration   |                        | Enabled features |               |                                |     |     |
|------------|------------------------|------------------------|------------------|---------------|--------------------------------|-----|-----|
|            | VDDH                   | VDD                    | EXTSUPPLY        | DCDC on VREGH | DCDC on VREGMAIN and VREGRADIO | USB | NFC |
| Config. 1  | Battery/Ext. regulator | N/A                    | Yes              | Yes           | Yes                            | Yes | No  |
| Config. 2  | N/A                    | Battery/Ext. regulator | No               | No            | Yes                            | Yes | Yes |
| Config. 3  | N/A                    | Battery/Ext. regulator | No               | No            | Yes                            | No  | No  |
| Config. 4  | USB (VDDH = VBUS)      | N/A                    | No               | No            | No                             | Yes | No  |

Table 105: Circuit configurations for QKAA aQFN94

Table 131: Bill of material for circuit configuration no. 4

### 9.3.13 PCB layout example

The PCB layout in the following figure is a reference layout for Circuit configuration no. 1 for QKAA aQFN94.

**Note:** Pay attention to how the capacitor C1 is grounded. It is not directly connected to the ground plane, but grounded via pin J31 and to the VSS die pad. This is done to create additional filtering of harmonic components.

For all available reference layouts, see the product page for nRF5340 on [www.nordicsemi.com](http://www.nordicsemi.com).

### 9.3.14 PMIC support

The nRF53 Series is comprehensively supported by Nordic Semiconductor's own range of PMICs (Power Management Integrated Circuits). These PMICs are meticulously designed to enhance the performance and efficiency of the nRF53 Series devices. This integration ensures the longest battery life and the highest reliability for the end application. The synergy between the nRF53 Series and the Nordic PMICs highlights Nordic Semiconductor's commitment to providing a complete and cohesive solution for their customers' needs in wireless technology applications.

## 9.4 Package thermal characteristics

A summary of the thermal characteristics for the different packages available for the IC can be found below.

| Symbol               | Package | Typ.  | Unit |
|----------------------|---------|-------|------|
| $\theta_{JA,aQFN94}$ | aQFN94  | 20.74 | °C/W |
| $\theta_{JB,aQFN94}$ | aQFN94  | 8.10  | °C/W |
| $\theta_{JC,aQFN94}$ | aQFN94  | 8.75  | °C/W |
| $\theta_{JA,WLCSP}$  | WLCSP   | 28.51 | °C/W |
| $\theta_{JB,WLCSP}$  | WLCSP   | 8.73  | °C/W |
| $\theta_{JC,WLCSP}$  | WLCSP   | 4.04  | °C/W |

Table 132: Package thermal characteristics

Values obtained by simulation following the EIA/JESD51-2 for still air condition using JEDEC PCB.

# 10 Recommended operating conditions

The operating conditions are the physical parameters that the chip can operate within.

| Symbol | Parameter                                       | Min.              | Nom. | Max. | Units |
|--------|-------------------------------------------------|-------------------|------|------|-------|
| VDD    | VDD supply voltage, independent of DCDC enable  | 1.7 <sup>37</sup> | 3.0  | 3.6  | V     |
| VDDH   | VDDH supply voltage, independent of DCDC enable | 2.5               | 3.7  | 5.5  | V     |
| VBUS   | VBUS USB supply voltage                         | 4.35              | 5.0  | 5.5  | V     |
| TA     | Operating temperature                           | -40               | 25   | 105  | °C    |

Table 133: Recommended operating conditions

## 10.1 WLCSP light sensitivity

All WLCSP package variants are sensitive to visible and close-range infrared light. This means that a final product design must shield the chip properly, either by final product encapsulation or by shielding/coating of the WLCSP device.

Some WLCSP package variants have a backside coating, where the marking side of the device is covered with a light absorbing film, while the side edges and the ball side of the device are still exposed and need to be protected. Other WLCSP package variants do not have any such protection.

The CLAA and CMAA WLCSP package variants have backside coating.

<sup>37</sup> See [Recommended operating conditions](#) on page 57 for details on VDD supply voltage needed during power-on reset.

# 11 Absolute maximum ratings

Maximum ratings are the extreme limits to which the chip can be exposed for a limited amount of time without permanently damaging it. Exposure to absolute maximum ratings for prolonged periods of time may affect the reliability of the device.

For accelerated lifetime testing (HTOL, etc.), supply voltage should not exceed the recommended operating conditions max value, see [Recommended operating conditions](#) on page 891.

|      | Min. | Max. | Unit |
|------|------|------|------|
| VDD  | -0.3 | 3.9  | V    |
| VDDH | -0.3 | 5.8  | V    |
| VBUS | -0.3 | 5.8  | V    |
| VSS  | -0.3 | 0    | V    |

Table 134: Supply voltage

|                                | Min. | Max.      | Unit |
|--------------------------------|------|-----------|------|
| V <sub>I/O</sub> , VDD ≤ 3.6 V | -0.3 | VDD + 0.3 | V    |
| V <sub>I/O</sub> , VDD > 3.6 V | -0.3 | 3.9       | V    |

# 12 Ordering information

This chapter contains information on device marking, ordering codes, and container sizes.

## 12.1 Device marking

The nRF5340 package is marked as shown in the following figure.

|    |    |    |    |     |     |
|----|----|----|----|-----|-----|
| N  | 5  | 3  | 4  | 0   |     |
| <P | P> | <V | V> | <H> | <P> |
| <Y | Y> | <W | W> | <L  | L>  |

Figure 280: Device marking

## 12.2 Box labels

The following figures show the box labels used for nRF5340.

Figure 281: Inner box label

|                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                         |

Table 142: Abbreviations

## 12.4 Code ranges and values

Defined here are nRF5340 code ranges and values.

| <PP> | Package | Size (mm)     | Pin/Ball count | Pitch (mm) |
|------|---------|---------------|----------------|------------|
| QK   | AQFN    | 7 x 7         | 94             | 0.4        |
| CL   | WLCSP   | 4.390 x 3.994 | 95             | 0.35       |
| CM   | WLCSP   | 4.390 x 3.994 | 95             | 0.35       |

Table 143: Package variant codes

| <VV> | Flash (kB) | RAM (kB) |
|------|------------|----------|
| AA   | 1024       | 512      |

Table 144: Function variant codes

| <H>       | Description                                        |
|-----------|----------------------------------------------------|
| [A . . Z] | Hardware version/revision identifier (incremental) |

Table 145: Hardware version codes

| <P>       | Description                                 |
|-----------|---------------------------------------------|
| [0 . . 9] | Production device identifier (incremental)  |
| [A . . Z] | Engineering device identifier (incremental) |

Table 146: Production configuration codes

| <F>                | Description                              |
|--------------------|------------------------------------------|
| [A . . N, P . . Z] | Version of preprogrammed firmware        |
| [0]                | Delivered without preprogrammed firmware |

Table 147: Production version codes

| <YY>        | Description                   |
|-------------|-------------------------------|
| [16 . . 99] | Production year: 2016 to 2099 |

Table 148: Year codes

| <WW>       | Description        |
|------------|--------------------|
| [1 . . 52] | Week of production |

## 12.5 Product options

Defined here are the nRF5340 product options.

The following table lists the ordering code, as well as the minimum ordering quantity (MOQ).

| Order code      | MOQ  | Comment                         |
|-----------------|------|---------------------------------|
| nRF5340-QKAA-R7 | 800  |                                 |
| nRF5340-QKAA-R  | 3000 |                                 |
| nRF5340-CLAA-R7 | 1500 | Not recommended for new designs |
| nRF5340-CLAA-R  | 7000 | Not recommended for new designs |
| nRF5340-CMAA-R7 | 1500 |                                 |
| nRF5340-CMAA-R  | 7000 |                                 |

Table 152: nRF5340 order codes

| Order code | Description             |
|------------|-------------------------|
| nRF5340-DK | nRF5340 Development Kit |

# 13 Legal notices

By using this documentation you agree to our terms and conditions of use. Nordic Semiconductor may change these terms and conditions at any time without notice.

## Liability disclaimer

Nordic Semiconductor ASA reserves the right to make changes without further notice to the product to improve reliability, function, or design. Nordic Semiconductor ASA does not assume any liability arising out of the application or use of any product or circuits described herein.

Nordic Semiconductor ASA does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. If there are any discrepancies, ambiguities or conflicts in Nordic Semiconductor's documentation, the Product Specification prevails.

Nordic Semiconductor ASA reserves the right to make corrections, enhancements, and other changes to this document without notice.

Customer represents that, with respect to its applications, it has all the necessary expertise to create and implement safeguards that anticipate dangerous consequences of failures, monitor failures and their consequences, and lessen the likelihood of failures that might cause harm, and to take appropriate remedial actions.

Nordic Semiconductor ASA assumes no liability for applications assistance or the design of customers' products. Customers are solely responsible for the design, validation, and testing of its applications as well as for compliance with all legal, regulatory, and safety-related requirements concerning its applications.

Nordic Semiconductor ASA's products are not designed for use in life-critical medical equipment, support appliances, devices, or systems where malfunction of Nordic Semiconductor ASA's products can reasonably be expected to result in personal injury. Customer may not use any Nordic Semiconductor ASA's products in life-critical medical equipment unless adequate design and operating safeguards by customer's authorized officers have been made. Customer agrees that prior to using or distributing any life-critical medical equipment that include Nordic Semiconductor ASA's products, customer will thoroughly test such systems and the functionality of such products as used in such systems.

Customer will fully indemnify Nordic Semiconductor ASA and its representatives against any damages, costs, losses, and/or liabilities arising out of customer's non-compliance with this section.
