

# nRF5340

## Product Specification

v1.6

# nRF5340 features

## Features:

- 1.7 V to 5.5 V supply voltage range
- Package variants
  - aQFN94™ package, 7x7 mm
  - WLCSP95 package, 4.4x4.0 mm
- Single 32 MHz crystal operation
- 1.8 V to 3.3 V regulated supply for external components
- Operating temperature from -40°C to 105°C
- 48 general purpose I/O pins

## Application core

- Arm® Cortex®-M33 with TrustZone® technology
  - 128 MHz or 64 MHz operation
  - 514 EEMBC CoreMark score running from flash, 4.0 CoreMark per MHz
  - Single-precision floating-point unit (FPU)
  - Digital signal processing (DSP) instructions
  - Data watchpoint and trace (DWT), embedded trace macrocell (ETM), instrumentation trace macrocell (ITM), and cross trigger interface (CTI)
  - Serial wire debug (SWD)
  - Trace port interface unit (TPIU)
    - 4-bit parallel trace of ITM and ETM trace data
    - Serial wire output (SWO) trace of ITM data
- 1 MB flash and 512 kB low leakage RAM
- Arm TrustZone CryptoCell™ -312 security subsystem
  - NIST 800-90B, AIS-31, and FIPS 140-2 compliant random number generator
  - AES-128 and 256: ECB, CBC, CMAC/CBC-MAC, CTR, CCM/CCM\*, GCM
  - SHA-1, SHA-2 up to 256 bits
  - Keyed-hash message authentication code (HMAC)
  - RSA public key cryptography with max key size 3072 bits
  - ECC support for most used curves
  - Application key management using derived key model
- Two-way set associative cache towards flash and QSPI XIP code regions
- QSPI peripheral for communicating with an external flash memory device
  - Execute in place with optional on-the-fly encryption and decryption
- Near field communication (NFC-A) tag with wake-on field and touch-to-pair
- Up to 5x SPI master/slave with EasyDMA
- Up to 4x I²C compatible two-wire master/slave with EasyDMA
- Up to 4x UART (CTS/RTS) with EasyDMA
- Audio peripherals - I²S compatible, digital microphone interface (PDM)
- Four pulse width modulator (PWM) units with EasyDMA
- 12-bit, 200 ksp/s ADC with EasyDMA - eight configurable channels with programmable gain
- Three 32-bit timers with counter mode
- Two 24-bit real-time counters (RTC)
- Two Quadrature decoders (QDEC)
- Distributed programmable peripheral interconnect (DPPI)
- Inter-processor communication (IPC)
- Mutually exclusive peripheral (MUTEX)
- USB 2.0 full speed (12 Mbps) controller

## Network core

- Arm Cortex-M33
  - 64 MHz operation
  - 244 EEMBC CoreMark score running from flash memory, 101 CoreMark per mA
  - Cross trigger interface (CTI)
  - Serial wire debug (SWD)
  - SWO trace port
- 256 kB flash and 64 kB low leakage RAM
- Bluetooth® 5.2, IEEE 802.15.4-2006, 2.4 GHz enabled transceiver
  - -98 dBm sensitivity in 1 Mbps Bluetooth Low Energy mode
  - -104 dBm sensitivity in 125 kbps Bluetooth Low Energy mode (long range)
  - -101 dBm sensitivity in IEEE 802.15.4
  - -40 dBm to +3 dBm configurable TX power
  - On-air compatible with nRF52, nRF51, nRF24L, and nRF24AP series devices
  - Supported data rates:
    - Bluetooth 5.2 - 2 Mbps, 1 Mbps, 500 kbps, and 125 kbps
    - IEEE 802.15.4-2006 - 250 kbps
    - Proprietary 2.4 GHz - 2 Mbps, 1 Mbps
  - Angle of Arrival (AoA) and Angle of Departure (AoD) direction finding using Bluetooth Low Energy
  - Single-ended antenna output (on-chip balun)
  - 128-bit AES/ECB/CCM/AAR co-processor (on-the-fly packet encryption)
    - 3.2 mA run current in TX (0 dBm)
    - 2.6 mA run current in RX
    - RSSI (1 dB resolution)
- SPI master/slave with EasyDMA
- I²C compatible two-wire master/slave with EasyDMA
- UART (CTS/RTS) with EasyDMA
- Three 32-bit timers with counter mode
- Two real-time counters (RTC)
- Temperature sensor
- Distributed programmable peripheral interconnect (DPPI)
- Inter-processor communication (IPC)
- Mutually exclusive peripheral (MUTEX)

**Applications:**

- Advanced computer peripherals and I/O devices
  - Multi-touch trackpad
- Advanced wearables
  - Health/fitness sensor and monitor devices
  - Wireless payment enabled devices
- Wireless audio devices
  - Bluetooth Low Energy Audio
  - True wireless earbuds
  - Headphones, microphones, and speakers
- Internet of things (IoT)
  - Smart home sensors and controllers
  - Industrial IoT sensors and controllers
- Interactive entertainment devices
  - Remote controls
  - Gaming controllers
- Professional lighting
  - Wireless connected luminaire

| 4.10 RESET — Reset control. . . . .                                  | 65         |
| 4.10.1 Power-on reset. . . . .                                       | 66         |
| 4.10.2 Pin reset. . . . .                                            | 66         |
| 4.10.3 Brownout reset. . . . .                                       | 66         |
| 4.10.4 Wakeup from System OFF mode reset. . . . .                    | 66         |
| 4.10.5 Soft reset. . . . .                                           | 66         |
| 4.10.6 Watchdog timer reset. . . . .                                 | 66         |
| 4.10.7 Network Force-OFF. . . . .                                    | 67         |
| 4.10.8 Retained registers. . . . .                                   | 67         |
| 4.10.9 Application core reset behavior. . . . .                      | 67         |
| 4.10.10 Network core reset behavior. . . . .                         | 68         |
| 4.10.11 Registers. . . . .                                           | 70         |
| 4.10.12 Electrical specification. . . . .                            | 72         |
| 4.11 CLOCK — Clock control. . . . .                                  | 72         |
| 4.11.1 HFCLK controller. . . . .                                     | 73         |
| 4.11.2 LFCLK controller. . . . .                                     | 77         |
| 4.11.3 Registers. . . . .                                            | 79         |
| 4.11.4 Electrical specification. . . . .                             | 97         |
| 4.12 OSCILLATORS — Oscillator control. . . . .                       | 98         |
| 4.12.1 High-frequency (32 MHz) crystal oscillator (HFXO). . . . .    | 98         |
| 4.12.2 Low-frequency (32.768 kHz) crystal oscillator (LFXO). . . . . | 99         |
| 4.12.3 Low-frequency (32.768 kHz) external source. . . . .           | 100        |
| 4.12.4 Registers. . . . .                                            | 101        |
| 4.12.5 Electrical specification. . . . .                             | 102        |
| <b>5 Application core . . . . .</b>                                  | <b>104</b> |
| 5.1 Block diagram. . . . .                                           | 104        |
| 5.2 CPU. . . . .                                                     | 106        |
| 5.2.1 Floating point interrupt. . . . .                              | 106        |
| 5.2.2 Electrical specification. . . . .                              | 106        |
| 5.2.3 CPU and support module configuration. . . . .                  | 107        |
| 5.3 Memory. . . . .                                                  | 107        |
| 5.3.1 Peripheral instantiation. . . . .                              | 108        |
| 5.4 Core components. . . . .                                         | 112        |
| 5.4.1 CACHE — Instruction/data cache. . . . .                        | 112        |
| 5.4.2 FICR — Factory information configuration registers. . . . .    | 121        |
| 5.4.3 UICR — User information configuration registers. . . . .       | 129        |
| 5.4.4 AHB multilayer. . . . .                                        | 133        |

| December 2020 | 1.0     | First release                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# 2 About this document

This document is organized into chapters that are based on the modules and peripherals available in the IC.

## 2.1 Document status

The document status reflects the level of maturity of the document.

| Document name                         | Description                                                                                                                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Objective Product Specification (OPS) | Applies to document versions up to 1.0.<br><br>This document contains target specifications for product development.                                                                                                                                             |
| Product Specification (PS)            | Applies to document versions 1.0 and higher.<br><br>This document contains final product specifications. Nordic Semiconductor ASA reserves the right to make changes at any time without notice in order to improve design and supply the best possible product. |

Table 1: Defined document names

## 2.2 Peripheral chapters

The chapters describing peripherals include the following information:

- A detailed functional description of the peripheral.
- The register configuration for the peripheral.
- The electrical specification tables, containing performance data which apply for the operating conditions described in [Recommended operating conditions](#) on page 891.

### 2.2.2 Peripheral instantiation

The peripherals have a set of security capabilities listed in [Peripherals](#) on page 149.

The following table describes the abbreviations used.

| Abbreviation | Description                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| NS           | Trustzone/security attribute is Non-secure - The peripheral is accessible as a Non-secure peripheral.                                      |
| S            | Trustzone/security attribute is Secure - The peripheral is accessible as a Secure peripheral.                                              |
| US           | Trustzone Map is user selectable - The Trustzone/security attribute of the peripheral is configurable.                                     |
| HF           | Trustzone Map is Hardware Fixed - The Trustzone/security attribute of the peripheral cannot be changed.                                    |
| NA           | Not Applicable - Peripheral has no DMA capability.                                                                                         |
| NSA          | NoSeparateAttribute - Peripheral with DMA and DMA transfer has the same security attribute as assigned to the peripheral.                  |
| SA           | SeparateAttribute - Peripheral with DMA and DMA transfers can have a different security attribute than the one assigned to the peripheral. |

Table 2: Instantiation table abbreviations

The Secure mapping column in the peripheral instantiation table defines configuration capabilities for the Arm TrustZone for Armv8-M secure attribute. The DMA security column describes the DMA capabilities of the peripheral.

The instantiation table has the following columns:

- Instance Column - Indicates the peripheral instance name followed by optional Trustzone attribute. A corresponding address is listed in Base address column indicating the base address for Secure and Non-secure Trustzone attribute. This optional Trustzone attribute is separated by a colon (:).
- Trustzone Column - This has 3 sub-columns indicating the Trustzone map, Trustzone attribute and DMA capability. The options are as listed in [Instantiation table abbreviations](#) on page 17.

## 2.3 Register overview table

The register overview table shows a summary of all peripheral registers.

The following table explains the columns of the register overview table.

| Field       | Description                                                                      |
|-------------|----------------------------------------------------------------------------------|
| Register    | Name of register                                                                 |
| Offset      | Offset address from peripheral base address                                      |
| TZ          | Security setting for split-security peripherals, and blank for other peripherals |
| Description | Short summary of intended use                                                    |

Table 3: Register overview table

## 2.4 Register tables

Individual registers are described using register tables. These tables are built up of two sections. The first three colored rows describe the position and size of the different fields in the register. The following rows describe the fields in more detail.

## 2.4.1 Fields and values

The **Id (Field Id)** row specifies the bits that belong to the different fields in the register. If a field has enumerated values, then every value will be identified with a unique value id in the **Value ID** column.

A blank space means that the field is reserved and read as undefined, and it also must be written as 0 to secure forward compatibility. If a register is divided into more than one field, a unique field name is specified for each field in the **Field** column. The **Value ID** may be omitted in the single-bit bit fields when values can be substituted with a Boolean type enumerator range, e.g. true/false, disable(d)/enable(d), on/off, and so on.

Values are usually provided as decimal or hexadecimal. Hexadecimal values have a 0x prefix, decimal values have no prefix.

The **Value** column can be populated in the following ways:

- Individual enumerated values, for example 1, 3, 9.
- Range of values, e.g. [0..4], indicating all values from and including 0 and 4.
- Implicit values. If no values are indicated in the **Value** column, all bit combinations are supported, or alternatively the field's translation and limitations are described in the text instead.

If two or more fields are closely related, the **Value ID**, **Value**, and **Description** may be omitted for all but the first field. Subsequent fields will indicate inheritance with '..'.

A feature marked **Deprecated** should not be used for new designs.

## 2.4.2 Permissions

Different fields in a register might have different access permissions enforced by hardware.

The access permission for each register field is documented in the **Access** column in the following ways:

| Access | Description          | Hardware behavior                                                                                                                 |
|--------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| R      | Read-only            | Field can only be read. A write will be ignored.                                                                                  |
| W      | Write-only           | Field can only be written. A read will return an undefined value.                                                                 |
| RW     | Read-write           | Field can be read and written multiple times.                                                                                     |
| W1     | Write-once           | Field can only be written once per reset. Any subsequent write will be ignored. A read will return an undefined value.            |
| RW1    | Read-write-once      | Field can be read multiple times, but only written once per reset. Any subsequent write will be ignored.                          |
| W0C    | Write 0 to clear     | Field can be read multiple times. A zero clears (set to zero) the corresponding bit in the register. Bits set to one are ignored. |
| W1C    | Write 1 to clear     | Field can be read multiple times. A one clears (set to zero) the corresponding bit in the register. Bits set to zero are ignored. |
| W1S    | Write 1 to set       | Field can be read multiple times. A one sets the corresponding bit in the register. Bits set to zero are ignored.                 |
| RME    | Read Modify External | When read, a side effect occurs.                                                                                                  |

# 3 Product overview

nRF5340 is a wireless, ultra-low power multicore System on Chip (SoC), integrating two fully programmable Arm Cortex-M33 processors, advanced security features, a range of peripherals, and a multiprotocol 2.4 GHz transceiver. The transceiver supports Bluetooth Low Energy, ANT<sup>™</sup>, and IEEE 802.15.4 for Thread and Zigbee protocols. It also allows the implementation of proprietary 2.4 GHz protocols.

The two Arm Cortex-M33 processors share the power, clock, and peripheral architecture with Nordic Semiconductor nRF51, nRF52, and nRF91 Series of SoCs, ensuring minimal porting efforts. The application core is a full-featured Arm Cortex-M33 processor including DSP instructions and FPU, running at up to 128 MHz with 1 MB of flash and 512 kB of RAM. The option to run the application processor at 64 MHz allows the CPU to increase energy efficiency. The network core is an Arm Cortex-M33 processor with a reduced feature set, designed for ultra-low power operation. It runs at a fixed 64 MHz frequency and contains 256 kB of flash and 64 kB of RAM.

The peripheral set offers a variety of analog and digital functionality enabling single-chip implementation of a wide range of applications. Arm TrustZone technology, Arm CryptoCell-312, and supporting blocks for system protection and key management are embedded for the advanced security needed for IoT applications.

## 3.1 Block diagram

The block diagram illustrates the overall system. More detailed diagrams of the two cores, including pins and EasyDMA connectivity, can be found in [Block diagram](#) on page 104 and [Block diagram](#) on page 135.

Figure 1: Simplified block diagram

## 3.2 Memory

The nRF5340 SoC contains two processor cores, each with flash memory and RAM that can be used for code and data storage.

| Core             | RAM                                                                                                                                          | Flash                 |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| Application core | 512 kB, arranged as follows: <ul style="list-style-type: none"> <li>256 kB CPU single-cycle RAM</li> <li>256 kB of additional RAM</li> </ul> | 1024 kB in 4 kB pages |
| Network core     | 64 kB total                                                                                                                                  | 256 kB in 2 kB pages  |

Table 5: nRF5340 memory configuration

All memory and registers are found in the same address space, as shown in [Memory map](#) on page 23. This includes the two blocks of 256 kB RAM, which are accessible in the memory map as one contiguous 512 kB block of RAM. The first 256 kB block of RAM has single-cycle access time from the CPU, while up to four CPU cycles additional latency occurs when accessing the additional 256 kB block of RAM.

The application core memory is mapped to the network core memory map. This means that the network core CPU can access and use the application core memory for shared memory communication. The application core can restrict network core access through the domain configuration (DCNF) PROTECT registers, see [DCNF — Domain configuration](#) on page 269. Access to secure memory or peripherals as defined by the [SPU — System protection unit](#) on page 651 is also prevented when the network core is marked as non-secure in an application using TrustZone technology.

**Note:** The EasyDMA masters of the network core peripherals cannot access the application core RAM. The network core processor cannot execute code directly from the application core flash or access QSPI XIP memories.

Figure 2: Memory map

### 3.2.1 RAM — Random access memory

RAM can be read and written an unlimited number of times.

Each RAM AHB slave within a core is connected to one or more RAM sections that has separate power control for System ON and System OFF mode operation. For details, see [VMC — Volatile memory controller](#) on page 802.

### 3.2.2 Flash — Non-volatile memory

Flash memory can be read an unlimited number of times by the CPU, but is restricted in the number of times it can be written to or erased. Flash memory is also restricted in how it can be written.

Writing to flash memory is managed by the non-volatile memory controller (NVMC), see [NVMC — Non-volatile memory controller](#) on page 400.

Flash memory is divided in pages, as listed in [nRF5340 memory configuration](#) on page 22.

### 3.2.3 XIP — Execute in place

Execute in Place (XIP) allows the application core to execute program code directly from the external flash memory device using the Quad serial peripheral interface (QSPI). The external flash memory supports on-the-fly encryption and decryption.

For details, see [QSPI — Quad serial peripheral interface](#) on page 461.

### 3.2.4 Access latency

When accessing memories or peripherals across bus bridges, additional access latency will occur. An example of this is when the network core accesses the application core memory or peripherals.

# 4 Power and clock management

The power and clock management system in nRF5340 is optimized for ultra-low power applications to ensure maximum power efficiency.

The core of the power and clock management system is the power management unit (PMU) shown in the following figure.

Figure 3: Power management unit

The PMU automatically tracks the power and clock resources required by the different components in the system at any given time. To achieve the lowest power consumption possible, the PMU optimizes the system by evaluating power and clock requests, automatically starting and stopping clock sources, and choosing regulator operation modes.

The nRF5340 start-up sequence after reset is described in [RESET — Reset control](#) on page 65.

## 4.1 System ON mode

System ON is the default operation mode after power-on reset.

In System ON, all functional blocks, such as the CPU and peripherals, can be in an IDLE or RUN state depending on the configuration set by the software and the state of the executing application. The network core's CPU and peripherals can be in IDLE state, RUN state, or Force-OFF mode (see [Force-OFF mode](#) on page 27).

The PMU can switch the appropriate internal power sources on and off, depending on power requirements. A peripheral's power requirement is directly related to its activity level, which increases and decreases when specific tasks are triggered or events are generated.

### Voltage and frequency scaling

nRF5340 automatically adjusts the internal voltages to optimize power efficiency.

Some configuration options request a higher internal voltage, which is seen as an increase in power consumption. These configurations are the following:

- Setting the frequency of the application core's clock to 128 MHz, see [Application core frequency scaling](#) on page 75. Increased power consumption in this mode is also observed when the CPU is sleeping, such as after executing the WFI (wait for interrupt) or WFE (wait for event) instructions.

Power consumption during System ON with CPU and peripherals in IDLE state sleep is reduced by configuring the application core's clock to 64 MHz before entering CPU sleep.

- Using QSPI with 96 MHz clock frequency
- Using the USB peripheral
- When debugging
- Requesting additional voltage on the VREGRADIO supply using [VREQCTRL — Voltage request control](#) on page 63

### 4.1.1 Power submodes

In System ON mode, when the CPU and all peripherals are in IDLE state, the system can reside in one of two power submodes.

The power submodes are:

- Constant latency
- Low-power

In Constant latency mode, the CPU wakeup latency and the PPI task response will be constant and kept at a minimum. This is secured by a set of resources that are always enabled. Compared to Low-power mode, the advantage of having a constant and predictable latency comes at a cost of increased power consumption. Constant latency mode is selected by triggering the [CONSTLAT](#) task.

In Low-power mode, the most power efficient supply option is chosen by the automatic power management system. Achieving the lowest power possible is at the expense of variations in CPU wakeup latency and PPI task response. Low-power mode is selected by triggering the [LOWPWR](#) task.

When the system enters System ON, it is by default in the Low-power submode.

## 4.2 System OFF mode

System OFF is the deepest power-saving mode the system can enter. In this mode, the system's core functionality is powered down and all ongoing tasks are terminated.

The device is put into System OFF mode using the register [SYSTEMOFF](#) on page 54 . The following initiate a wakeup from System OFF:

- The DETECT signal, generated by the GPIO peripheral
- The ANADETECT signal, generated by the LPCOMP peripheral
- The SENSE signal, generated by the NFCT peripheral to wake-on-field
- A valid USB voltage on the **VBUS** pin is detected
- A debug session is started
- A pin reset

When the device wakes up from System OFF, a system reset is performed. For more details, see [Application core reset behavior](#) on page 67.

One or more RAM sections can be retained in System OFF depending on the RAM retention settings in the peripheral [VMC — Volatile memory controller](#) on page 802.

Before entering System OFF, the EasyDMA enabled peripheral must not active when entering System OFF. It is also recommended that the network core is in IDLE state, meaning peripherals are stopped and the CPU is idle.

### 4.2.1 Emulated System OFF mode

When the device is in Debug Interface mode, System OFF is emulated to ensure that all resources required for debugging are available during System OFF.

Resources required for debugging include the following key components:

- [Debug Interface mode](#) on page 818
- [CLOCK — Clock control](#) on page 72
- [POWER — Power control](#) on page 46
- [OSCILLATORS — Oscillator control](#) on page 98
- [REGULATORS — Regulator control](#) on page 51
- [RESET — Reset control](#) on page 65
- [NVMC — Non-volatile memory controller](#) on page 400
- CPU
- Flash memory
- RAM

Because the CPU is kept on in an emulated System OFF mode, it is recommended to add an infinite loop directly after entering System OFF. This prevents the CPU from executing code that normally should not be executed. For more information, see [Debug and trace](#) on page 813.

## 4.3 Force-OFF mode

Force-OFF mode is only applicable for the network core.

The register interface [RESET — Reset control](#) on page 65 is used by the application core to force the network core to Force-OFF mode. In this mode, the network core is stopped in order to achieve the lowest power consumption possible. When the network core is in Force-OFF mode, only the application core can release the mode, causing the network core to wake up and start the CPU again.

Before the application core sets the network core to Force-OFF mode, it is recommended that the network core is in IDLE state, as defined by the following:

- All peripherals are stopped
- Additional voltage on the VREGRADIO supply is canceled using [VREQCTRL — Voltage request control](#) on page 63
- The CPU is in IDLE state, meaning it is running the WFI or WFE instruction

When the network core wakes up from Force-OFF mode, it is reset. For more details, see [Network core reset behavior](#) on page 68.

Several RAM sections can be retained in Force-OFF mode depending on the RAM retention settings in the peripheral [VMC — Volatile memory controller](#) on page 802.

### 4.3.1 Emulated Force-OFF mode

If the device is in Debug Interface mode, Force-OFF mode will be emulated to secure the required resources needed for debugging.

When Force-OFF mode is emulated, the CPU and all peripherals are reset. The CPU is prevented from running during debug access to a core's resources, including writing to RAM, flash, and/or peripherals. See [Debug and trace](#) on page 813 for more information.

## 4.4 Current consumption

Because the Power Management Unit (PMU) is constantly adjusting the different power and clock sources, estimating an application's current consumption can be challenging when the measurements cannot be performed directly on the hardware. To facilitate the estimation process, a set of current consumption scenarios is provided to show the typical current drawn from the VDD or VDDH supply.

Each scenario specifies a set of operations and conditions applying to the given scenario. All scenarios are listed in [Electrical specification](#) on page 30. The following table shows a set of common conditions used in all scenarios, unless otherwise stated in the description of a given scenario.

| Condition               | Value                                                                                                                            | Note                                                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Supply                  | 3 V on VDD/VDDH (normal voltage mode)                                                                                            |                                                                                                                                                                                   |
| Temperature             | 25°C                                                                                                                             |                                                                                                                                                                                   |
| CPU                     | WFI (wait for interrupt)/WFE (wait for event) sleep                                                                              |                                                                                                                                                                                   |
| Peripherals             | All idle                                                                                                                         |                                                                                                                                                                                   |
| Clock                   | HFCLK=HFINT running at 64 MHz<br>LFCLK=Not running                                                                               |                                                                                                                                                                                   |
| Regulator               | DC/DC on VREGMAIN, VREGRADIO, and VREGH (when used)                                                                              |                                                                                                                                                                                   |
| Application core RAM    | 8 kB                                                                                                                             | In System ON, RAM value refers to the amount of RAM that is switched on. The remainder of RAM is non retained. In System OFF, RAM value refers to amount of RAM that is retained. |
| Network core RAM        | 0 kB                                                                                                                             |                                                                                                                                                                                   |
| Cache enabled           | Yes                                                                                                                              | Only applies when the CPU is running from flash memory.                                                                                                                           |
| Network core forced off | Yes                                                                                                                              |                                                                                                                                                                                   |
| 32 MHz crystal          | SMD 2016<br>32 MHz<br>$f_{tol} = \pm 30$ ppm<br>$C_L = 8$ pF<br>$R_S \leq 50 \Omega$<br>$D_L \leq 100 \mu W$                     | Only applies when the high frequency crystal oscillator (HFXO) is running. HFXO is used when the radio is running.                                                                |
| 32 kHz crystal          | SMD 2012<br>32.768 kHz<br>$f_{tol} = \pm 20$ ppm<br>$C_L = 9$ pF<br>$C_0 = 1.3$ pF<br>$R_L = 70 k\Omega$<br>$D_L \leq 1.0 \mu W$ | Only applies when the low frequency crystal oscillator (LFXO) is running.                                                                                                         |

Figure 4: System OFF, 0 kB application RAM, wake on reset (typical values)

Figure 5: System ON, wake on any event, power-fail comparator enabled (typical values)

#### 4.4.1.2 Application CPU running

The application CPU running parameters are obtained using the following compiler version:

Compiler: Arm version 6.14 (armclang)

Compiler flags:

```
-std=c99 --target=arm-arm-none-eabi -mcpu=cortex-m33 -mfpu=fpv5-sp-d16 -mfloat-abi=hard -fno-rtti -flto -funsigned-char -mcmse -Omax -ffunction-sections
```

Linker flags:

```
-Omax
```

20 kB of RAM in application core switched on and retained in execute-from-flash cases, and 44 kB in execute-from-RAM cases.

| Symbol    | Description                                                         | Min. | Typ. | Max. | Units |
|-----------|---------------------------------------------------------------------|------|------|------|-------|
| I_APPCPU0 | CPU running CoreMark from flash, regulator = LDO, clock = HFINT128M |      | 15.5 |      | mA    |
| I_APPCPU2 | CPU running CoreMark from flash, clock = HFXO128M                   |      | 8.0  |      | mA    |
| I_APPCPU3 | CPU running CoreMark from flash, clock = HFXO64M                    |      | 3.6  |      | mA    |
| I_APPCPU4 | CPU running CoreMark from flash, clock = HFINT128M                  |      | 7.8  |      | mA    |
| I_APPCPU5 | CPU running CoreMark from flash                                     |      | 3.3  |      | mA    |
| I_APPCPU8 | CPU running CoreMark from RAM, clock = HFINT128M                    |      | 7.9  |      | mA    |

| Symbol                | Description                                     | Min. | Typ. | Max. | Units |
|-----------------------|-------------------------------------------------|------|------|------|-------|
| I <sub>APPCPU9</sub>  | CPU running CoreMark from RAM                   |      | 3.4  |      | mA    |
| I <sub>APPCPU10</sub> | CPU running CoreMark from RAM, clock = HFXO128M |      | 8.2  |      | mA    |
| I <sub>APPCPU11</sub> | CPU running CoreMark from RAM, clock = HFXO64M  |      | 3.6  |      | mA    |

#### 4.4.1.3 Network CPU running

The network CPU running parameters are obtained using the following compiler version:

Compiler: Arm version 6.14 (armclang)

```
Compiler flags: -std=c99 --target=arm-arm-none-eabi -mcpu=cortex-m33+nodsp -mfpv=none -
mfloat-abi=soft -fno-rtti -flto -funsigned-char -Omax -ffunction-sections
```

Linker flags:

```
-Omax
```

20 kB of RAM in network core switched on and retained in execute-from-flash cases, and 40 kB in execute-from-RAM cases.

Clock and regulator settings only apply to network core. The settings in the application core are the same as the common conditions.

| I <sub>I2S2</sub> | I2S transferring data @ 2 x 16 bit x 48 kHz (CONFIG.MCKFREQ = 505286656, CONFIG.RATIO = 32X), clock = HFXO ACLK @ 12.288 MHz |      | 2310 |      | uA    |

#### 4.4.1.6 LPCOMP active

| Symbol                 | Description    | Min. | Typ. | Max. | Units |
|------------------------|----------------|------|------|------|-------|
| I <sub>LPCOMP,EN</sub> | LPCOMP enabled |      | 45   |      | uA    |

#### 4.4.1.7 NFCT active

| Symbol                 | Description                                                                       | Min. | Typ. | Max. | Units |
|------------------------|-----------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>SENSE</sub>     | System ON, current in SENSE STATE (this current does not apply when in NFC field) |      | 1.3  |      | uA    |
| I <sub>ACTIVATED</sub> | System ON, current in ACTIVATED STATE, clock = HFXO64M                            |      | 1080 |      | uA    |

#### 4.4.1.8 PDM active

| Symbol                    | Description                                                                                                         | Min. | Typ. | Max. | Units |
|---------------------------|---------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>PDM,RUN</sub>      | PDM receiving and processing data @ 1 MHz (RATIO = 64, PDMCLKCTRL = 135274496), stereo mode, clock = HFXO64M        |      | 655  |      | uA    |
| I <sub>PDM,RUN,ACLK</sub> | PDM receiving and processing data @ 1 MHz (RATIO = 64, PDMCLKCTRL = 343597056), stereo mode, HFXO ACLK = 12.288 MHz |      | 1045 |      | uA    |

#### 4.4.1.9 PWM active

| Symbol                    | Description                                                   | Min. | Typ. | Max. | Units |
|---------------------------|---------------------------------------------------------------|------|------|------|-------|
| I <sub>PWM,RUN0</sub>     | PWM running at 125 kHz, top = 10, duty = 50%                  |      | 560  |      | uA    |
| I <sub>PWM,RUN1</sub>     | PWM running at 16 MHz, top = 10, duty = 50%                   |      | 560  |      | uA    |
| I <sub>PWM,RUN1,LDO</sub> | PWM running at 16 MHz, top = 10, duty = 50%; regulator = LDO  |      | 1035 |      | uA    |
| I <sub>PWM,RUN2</sub>     | PWM running at 125 kHz, top = 10, duty = 50%, clock = HFXO64M |      | 750  |      | uA    |
| I <sub>PWM,RUN3</sub>     | PWM running at 16 MHz, top = 10, duty = 50%, clock = HFXO64M  |      | 755  |      | uA    |

#### 4.4.1.10 QDEC active

| Symbol                | Description  | Min. | Typ. | Max. | Units |
|-----------------------|--------------|------|------|------|-------|
| I <sub>QDEC,RUN</sub> | QDEC running |      | 480  |      | uA    |

#### 4.4.1.11 QSPI active

| Symbol                   | Description                                                                                                                            | Min. | Typ. | Max. | Units |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>QSPI,IDLE</sub>   | QSPI idle (enabled, but not activated)                                                                                                 |      | 45   |      | uA    |
| I <sub>QSPI,ACTIVE</sub> | QSPI active (activated, but not transferring data)                                                                                     |      | 1790 |      | uA    |
| I <sub>QSPI,DATA</sub>   | QSPI transferring data (activated, and transferring data to/from external flash memory), SCKFREQ = 96 MHz, quad mode, clock = HFXO192M |      | 4430 |      | uA    |

#### 4.4.1.12 RADIO transmitting/receiving

64 kB of network core RAM switched on and retained.

Clock and regulator settings only apply to network core. The settings in the application core are the same as the common conditions.

| Symbol                 | Description                                                                                                         | Min. | Typ. | Max. | Units |

| I <sub>WDT,NET</sub>     | Network MCU WDT started, 64 kB network RAM   |      | 3.2  |      | uA    |

#### 4.4.1.23 Compounded

These are scenarios where both cores are active. 20 kB of RAM in the application core and 64 kB of RAM in the network core are switched on and retained.

In scenarios where both cores are active, the clock and regulator settings apply to both.

## 4.5 Power supply modes and regulators

nRF5340 supports two power supply voltage ranges, each with a dedicated power supply pin. The PMU automatically activates the correct voltage regulator depending on which power supply pin is used.

The nRF5340 PMU controls three different regulators to support the following power supply modes:

- [Normal voltage mode](#) on page 42 - Powers the device through the VDD pin
- [High voltage mode](#) on page 43 - Powers the device through the VDDH pin

In addition, the nRF5340 has a dedicated regulator used only for USB, controlled and operated separately using [USBREG — USB regulator control](#) on page 58.

The following figure shows the regulators and how they are connected to the supply pins.

Figure 8: Regulators used in nRF5340

### 4.5.1 Normal voltage mode

When the device operates in normal voltage mode, only the main voltage regulator (VREG MAIN) and the radio voltage regulator (VREG RADIO) are used.

Figure 9: Regulator usage in normal voltage mode

The VDD and VDDH pins are connected together. The external power supply is connected to the both pins. In this case, the VREGH regulator is automatically deactivated.

In normal voltage mode, each regulator can operate in LDO or DC/DC mode. See [Normal voltage mode](#) on page 51 for details about configuration of the regulators in this mode.

#### 4.5.2 High voltage mode

When the device operates in high voltage mode, the high voltage regulator (VREGH), the main voltage regulator (VREG MAIN), and the radio voltage regulator (VREG RADIO) are used.

Figure 10: Regulator usage in high voltage mode

The external power supply is connected to the VDDH pin. The VREG MAIN and VREG RADIO regulators power the internal circuitry from the VDD pin. The VREGH regulator supplies the VDD pin.

By default, the high voltage regulator is configured to source external components from the VDD pin. To save power this feature must be disabled. For details, see [High voltage mode](#) on page 52.

In high voltage mode, each of the three regulators can operate in LDO or DC/DC mode. See [High voltage mode](#) on page 52 for details about configuring the regulators in this mode.

### 4.5.3 Power supply supervisor

Several voltage monitoring devices, enabled through the power management unit (PMU), monitor the connected power supply.

The following figure illustrates the main components for power supply supervision.

Figure 11: Power supply supervision in nRF5340

The power supply mode detector determines which supply pin is used when the device is powered up. It selects the appropriate power supply mode, generates the enable signal that automatically enables VREGH, and generates a power-on reset (POR) initializing the device. For an overview of the supply modes, see [Power supply modes and regulators](#) on page 42.

The brownout detector monitors the VDD supply (input of the VREGMAIN regulator) to ensure safe operation. It generates a brownout reset (BOR) when the voltage is too low, holding the device in reset when the voltage is too low for safe operation. The brownout reset voltage is defined in parameters  $V_{BOR,OFF}$  and  $V_{BOR,ON}$ .

#### 4.5.3.1 Power-fail comparator

The power-fail comparator (POF) can provide the CPU with an early warning of an impending power supply failure.

The POF can be used to signal the application when the supply voltage drops below a configured threshold. The POF will not reset the system, but give the CPU time to prepare for an orderly power-down. The following figure shows the main elements of the POF.

Figure 12: Power-fail comparator

Using the POF is optional, and must be enabled and configured through the register **POFCON (Retained)** on page 55.

Depending on the supply mode (see [Power supply modes and regulators](#) on page 42), the thresholds  $V_{POF}$  and  $V_{POFH}$  must be configured to a suitable level through the **POFCON** register. When the supply voltage falls below the defined threshold, the POF generates the event **POFWARN** that is sent to the **POWER** module within both the application and network cores. Software running on both cores uses this signal to prepare for a power failure. This event is also generated when the supply voltage is below the threshold at the time the power-fail comparator is enabled, or if the threshold is reconfigured to a level above the supply voltage.

If the POF is enabled and the supply voltage is below the threshold, the POF prevents the **NVMC** from performing write operations to the NVM.

To save power, the power-fail comparator is not active in System OFF or in System ON when HFCLK is not running.

The POF features a hysteresis of  $V_{POFHYST}$ , as illustrated in the following figure.

Figure 13: POF hysteresis and POFWARN event (BOR = brownout reset)

The POF hysteresis voltage is defined with the  $V_{POFHYST}$  parameter in [Electrical specification](#) on page 57.

## 4.6 POWER — Power control

The POWER peripheral provides an interface for the power and clock subsystem for task, event, and interrupt related settings.

Each core has its own POWER peripheral that is responsible for requesting resources from the power and clock subsystem. The power and clock subsystem ensure that the power mode with the proper latency settings is selected when requested by an instance of the POWER peripheral. This means that for the core, the Constant latency mode is prioritized over Low-power mode. For an overview of power modes, see [Power submodes](#) on page 26.

The **POFWARN** event is a system level event that enables each core to react quickly if there is a power failure. The power-fail comparator must be configured and enabled in order to receive the event, see [Power-fail comparator](#) on page 45 for more information.

Power control of the RAM blocks is controlled by the Volatile memory controller (VMC), see [VMC — Volatile memory controller](#) on page 802.

**Note:** Registers [INTEN](#) on page 50, [INTENSET](#) on page 50, and [INTENCLR](#) on page 50 are shared between the POWER and CLOCK peripherals.

### 4.6.1 Registers

#### Instances

| Instance   | Domain      | Base address | TrustZone |     |     | Split access | Description   |
|------------|-------------|--------------|-----------|-----|-----|--------------|---------------|
|            |             |              | Map       | Att | DMA |              |               |
| POWER : S  | APPLICATION | 0x50005000   | US        | S   | NA  | No           | Power control |
| POWER : NS |             | 0x40005000   |           |     |     |              |               |
| POWER      | NETWORK     | 0x41005000   | HF        | NS  | NA  | No           | Power control |

 ## 4.7 REGULATORS — Regulator control

All system components are powered from the on-chip voltage regulators. These regulators are responsible for converting the voltage supplied on the VDD or VDDH pins to adequate voltages to be used internally.

The available regulators can be configured in multiple ways to accommodate different input voltage ranges. Some modes support sourcing power to external circuitry. The voltage modes that are supported by nRF5340 are listed in the following table.

| Voltage mode        | Input voltage range | Output voltage range |
|---------------------|---------------------|----------------------|
| Normal voltage mode | 1.7 V to 3.6 V      | -                    |
| High voltage mode   | 2.5 V to 5.5 V      | 1.8 V to 3.3 V       |

Table 7: Supported voltage modes

For an overview on the available regulators, see [Power supply modes and regulators](#) on page 42.

### 4.7.1 Normal voltage mode

Normal voltage mode uses the main regulator (VREGMAIN) and the radio regulator (VREGADIO).

The VREGMAIN and VREGRADIO regulators operate in LDO mode by default. DC/DC mode is enabled independently for each regulator using [VREGMAIN.DCDCEN \(Retained\)](#) on page 56 and [VREGRADIO.DCDCEN \(Retained\)](#) on page 56 respectively.

When configured as shown in the following figure, nRF5340 enters normal voltage mode. Here both regulators are in DC/DC mode. An external LC filter is required for each regulator in DC/DC mode. If a regulator is only to be used in LDO mode, the inductor for this regulator is not needed. In this mode, the VDDH pin must be connected to VDD, even if the high voltage regulator (VREGH) is not in use.

(\*) Inductors required only if DC/DC mode is used

Figure 14: Normal voltage mode

Operating a regulator in DC/DC mode reduces the overall power consumption due to higher efficiency than in LDO mode. Regulator efficiency in DC/DC mode varies depending on the supply voltage and the current drawn from the regulators.

### 4.7.2 High voltage mode

High voltage mode uses the main regulator (VREGMAIN), the high voltage regulator (VREGH), and the radio regulator (VREGRADIO).

All regulators operate in LDO mode by default. DC/DC mode is enabled independently for each regulator using [VREGMAIN.DCDCEN \(Retained\)](#) on page 56, [VREGH.DCDCEN \(Retained\)](#) on page 56, and [VREGRADIO.DCDCEN \(Retained\)](#) on page 56.

When configured as shown in the following figure, nRF5340 enters high voltage mode. Here all three regulators are in DC/DC mode. An external LC filter is required for each of the regulators in DC/DC mode. The inductor is not needed when the regulator is exclusively in LDO mode.

Figure 15: High voltage mode

Operating a regulator in DC/DC mode reduces the overall power consumption due to higher efficiency than in LDO mode. Regulator efficiency in DC/DC mode varies depending on the supply voltage and the current drawn from the regulators.

#### 4.7.2.1 External circuitry supply

In high voltage mode, the output from VREGH can be used to supply external circuitry from the VDD pin.

As illustrated in [High voltage mode](#) on page 52, external circuitry can be powered from the VDD pin. The VDD output voltage is programmed in the register UICR.VREGHVOUT.

The supported output voltage range depends on the supply voltage provided to the VDDH pin. The difference between voltage supplied on the VDDH pin and the voltage output on the VDD pin is defined by the  $V_{\text{REGH,DROP}}$  parameter in [Regulator specifications, VREGH stage](#) on page 57.

Supplying power to external circuitry is allowed in both System OFF and System ON mode.

**Note:** The maximum allowed current drawn by external circuitry is dependent on the total internal current draw. The maximum current that can be drawn externally from REGH is defined in [Regulator specifications, VREGH stage](#) on page 57.

#### 4.7.3 GPIO levels

The GPIO high reference voltage depends on the regulator voltage mode.

In normal voltage mode, the GPIO high level equals the voltage supplied to the VDD pin. In high voltage mode, it equals the level specified in the [VREGHVOUT](#) register.

## 4.7.4 Registers

### Instances

| Instance        | Domain      | Base address | TrustZone |     |     | Split access | Description             |

## 4.7.5 Electrical specification

### 4.7.5.1 Recommended operating conditions

| Symbol              | Description                                      | Min. | Typ. | Max. | Units |
|---------------------|--------------------------------------------------|------|------|------|-------|
| V <sub>DD,POR</sub> | VDD supply voltage needed during power-on reset. | 1.75 |      |      | V     |
| V <sub>DD</sub>     | Normal voltage mode operating voltage.           | 1.7  |      | 3.6  | V     |
| V <sub>DDH</sub>    | High voltage mode operating voltage.             | 2.5  |      | 5.5  | V     |

### 4.7.5.2 Regulator specifications, VREGH stage

| Symbol                 | Description                                                                                                                                                                                                                                       | Min. | Typ. | Max. | Units |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| V <sub>DDOUT</sub>     | VDD output voltage.                                                                                                                                                                                                                               | 1.8  |      | 3.3  | V     |
| V <sub>DDOUT,ERR</sub> | VDD output voltage error (deviation from setting in %).                                                                                                                                                                                           | -10  |      | +5   | %     |
| I <sub>EXT,OFF</sub>   | External current draw <sup>1</sup> allowed in high voltage mode (supply on VDDH) during System OFF.                                                                                                                                               |      |      | 1    | mA    |
| I <sub>EXT,DCDC</sub>  | External current draw <sup>1</sup> allowed in High Voltage mode (supply on VDDH) when VREGMAIN and VREGRADIO are in DC/DC mode. Assumes worst-case power consumption from both cores <sup>2</sup> , and at the lowest VDD output voltage setting. |      |      | 7    | mA    |
| I <sub>EXT,LDO</sub>   | External current draw <sup>1</sup> allowed in High Voltage mode (supply on VDDH) when VREGMAIN and VREGRADIO are in LDO mode. Assumes worst-case power consumption from both cores <sup>2</sup> , and at the lowest VDD output voltage setting.   |      |      | 1    | mA    |
| V <sub>REGH,DROP</sub> | Required difference between input voltage (VDDH) and output voltage (VDD, configured in VREGHVOUT on page 130), VDDH > VDD                                                                                                                        |      |      | 0.3  | V     |

### 4.7.5.3 Regulator startup times

| Symbol                          | Description                                                                 | Min. | Typ. | Max. | Units |
|---------------------------------|-----------------------------------------------------------------------------|------|------|------|-------|
| t <sub>RISE,VREGHOUT</sub>      | VREGH output (VDD) rise time after VDDH reaches minimum VDDH supply voltage | ..   | ..   | ..   |       |
| t <sub>RISE,VREGHOUT,10us</sub> | VDDH rise time 10 μs                                                        |      | 0.2  | 1.6  | ms    |
| t <sub>RISE,VREGHOUT,10ms</sub> | VDDH rise time 10 ms                                                        |      | 5    |      | ms    |
| t <sub>RISE,VREGHOUT,50ms</sub> | VDDH rise time 50 ms                                                        | 30   | 50   | 80   | ms    |

<sup>1</sup> External current draw is defined as the sum of all GPIO currents and the current being drawn from VDD.

<sup>2</sup> In practice, the maximum external current draw is limited by the maximum output current of VREGH, subtracting the actual current being drawn from VDD.

#### 4.7.5.4 Power-fail comparator

| Symbol        | Description                                                                                                                                                                    | Min. | Typ. | Max. | Units |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| $V_{POF,NV}$  | Nominal power level warning thresholds (falling supply voltage) in normal voltage mode (supply on VDD). Levels are configurable between min. and max. in increments of 100 mV. |      | 1.7  | 2.8  | V     |
| $V_{POF,HV}$  | Nominal power level warning thresholds (falling supply voltage) in high Voltage mode (supply on VDDH). Levels are configurable between min. and max. in increments of 100 mV.  |      | 2.7  | 4.2  | V     |
| $V_{POFTOL}$  | Threshold voltage tolerance (applies in both normal voltage mode and high voltage mode).                                                                                       | -5   |      | +5   | %     |
| $V_{POFHYST}$ | Threshold voltage hysteresis (applies in both normal voltage mode and high voltage mode).                                                                                      | 40   | 50   | 60   | mV    |
| $V_{BOR,OFF}$ | Brownout reset voltage range System OFF mode. Brownout only applies to the voltage on VDD.                                                                                     | 1.54 |      | 1.64 | V     |
| $V_{BOR,ON}$  | Brownout reset voltage range System ON mode. Brownout only applies to the voltage on VDD.                                                                                      | 1.57 |      | 1.63 | V     |

### 4.8 USBREG — USB regulator control

The USB peripheral has its own voltage regulator. When using the USB peripheral, a 5 V USB supply needs to be provided on the VBUS pin.

The USB peripheral has a dedicated internal voltage regulator for converting the VBUS supply to 3.3 V to be used by the USB signalling interface (D+ and D- lines, and pull-up on D+). The rest of the USB peripheral (USBD) is supplied through the main supply like other on-chip features. As a consequence, both VBUS and combinations of VDDH and VDD are required for USB peripheral operation. For details on configuring the main supplies, see [Power supply modes and regulators](#) on page 42.

When VBUS rises into its valid range, the software is notified through the [USBDETECTED](#) event. The [USBREMOVED](#) event is sent when VBUS goes below its valid range. Use these events to implement the USBD startup sequence described in [USBD power-up sequence](#) on page 759.

When VBUS rises into its valid range while the device is in System OFF, the device resets and transitions to System ON mode. The [RESETREAS](#) register will have the VBUS bit set to indicate the source of the wakeup.

See [VBUS detection specifications](#) on page 63 for the voltage level where events are sent ( $V_{BUS,DETECT}$  and  $V_{BUS,REMOVE}$ ) or where the system causes a wakeup from System OFF ( $V_{BUS,DETECT}$ ).

When the USBD peripheral is enabled through the [ENABLE](#) register and VBUS is detected, the regulator is turned on. A [USBPWRRDY](#) event is sent when the regulator's worst case settling time has elapsed, indicating to the software that it can enable the USB pull-up to signal a USB connection to the host.

The software can read the state of the VBUS detection and regulator output readiness at any time through the [USBREGSTATUS](#) register.

Figure 16: USB voltage regulator

To ensure stability, the input and output of the USB regulator need to be decoupled with a suitable decoupling capacitor  $C_{VBUS}$ . See [Reference circuitry](#) on page 863 for the recommended values.

## 4.8.1 Registers

### Instances

| Instance          | Domain      | Base address | TrustZone |     |     | Split access | Description           |
|-------------------|-------------|--------------|-----------|-----|-----|--------------|-----------------------|
|                   |             |              | Map       | Att | DMA |              |                       |
| USBREGULATOR : S  | APPLICATION | 0x50037000   | US        | S   | NA  | No           | USB regulator control |
| USBREGULATOR : NS |             | 0x40037000   |           |     |     |              |                       |

### Register overview

| Register            | Offset | TZ | Description                                                 |

## 4.8.2 Electrical specification

### 4.8.2.1 USB operating conditions

| Symbol            | Description                | Min.                  | Typ. | Max.                     | Units |
|-------------------|----------------------------|-----------------------|------|--------------------------|-------|
| V <sub>BUS</sub>  | Supply voltage on VBUS pin | 4.35                  | 5    | 5.5                      | V     |
| V <sub>DPDM</sub> | Voltage on D+ and D- lines | V <sub>SS</sub> - 0.3 |      | V <sub>USB33</sub> + 0.3 | V     |

### 4.8.2.2 USB regulator specifications

| Symbol                       | Description                                                                            | Min. | Typ. | Max. | Units |
|------------------------------|----------------------------------------------------------------------------------------|------|------|------|-------|
| I <sub>USB,QUIES</sub>       | USB regulator quiescent current drawn from VBUS (USB enabled)                          |      | 170  |      | μA    |
| t <sub>USBPWRRDY</sub>       | Time from USB enabled to USBPWRRDY event triggered, V <sub>BUS</sub> supply provided   |      | 1    |      | ms    |
| V <sub>USB33</sub>           | On voltage at the USB regulator output (DECUSB pin)                                    | 3.0  | 3.3  | 3.6  | V     |
| R <sub>SOURCE,VBUS</sub>     | Maximum source resistance on VBUS, including cable, when VDDH is not connected to VBUS |      |      | 6    | Ω     |
| R <sub>SOURCE,VBUSVDDH</sub> | Maximum source resistance on VBUS, including cable, when VDDH is connected to VBUS     |      |      | 3.8  | Ω     |
| C <sub>DECUSB</sub>          | Decoupling capacitor on the DECUSB pin                                                 | 2.35 | 4.7  | 5.5  | μF    |

### 4.8.2.3 VBUS detection specifications

| Symbol                  | Description                                                  | Min. | Typ. | Max. | Units |
|-------------------------|--------------------------------------------------------------|------|------|------|-------|
| V <sub>BUS,DETECT</sub> | Voltage at which rising VBUS gets reported by USBDETECTED    | 3.4  | 4.0  | 4.3  | V     |
| V <sub>BUS,REMOVE</sub> | Voltage at which decreasing VBUS gets reported by USBREMOVED | 3.0  | 3.6  | 3.9  | V     |

## 4.9 VREQCTRL — Voltage request control

The VREQCTRL can request additional voltage on the VREGRADIO regulated supply to support +3 dBm TX power on RADIO.

Setting the VREGRADIO.VREQH register will request high voltage. The request is active until the register is cleared. Status register VREGRADIO.VREQHREADY indicates when the regulator has changed to high voltage.

## 4.9.1 Registers

### Instances

| Instance | Domain  | Base address | TrustZone |     |     | Split access | Description             |
|----------|---------|--------------|-----------|-----|-----|--------------|-------------------------|
|          |         |              | Map       | Att | DMA |              |                         |
| VREQCTRL | NETWORK | 0x41004000   | HF        | NS  | NA  | No           | Voltage request control |

### Register overview

| Register             | Offset | TZ | Description                                                                                                                                               |
|----------------------|--------|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| VREGRADIO.VREQH      | 0x500  |    | Request high voltage on RADIO<br><br>After requesting high voltage, the user must wait until VREQHREADY is set to Ready<br><br>This register is retained. |
| VREGRADIO.VREQHREADY | 0x508  |    | High voltage on RADIO is ready                                                                                                                            |

#### 4.9.1.1 VREGRADIO.VREQH (Retained)

Address offset: 0x500

Request high voltage on RADIO

After requesting high voltage, the user must wait until VREQHREADY is set to Ready

This register is retained.

## 4.9.2 Electrical specification

### 4.9.2.1 VREQCTRL electrical specifications

| Symbol                | Description                                | Min. | Typ. | Max. | Units         |
|-----------------------|--------------------------------------------|------|------|------|---------------|
| $t_{VREQH,VREQREADY}$ | Time from VREQH requested until VREQREADY. |      | 12   |      | $\mu\text{s}$ |

## 4.10 RESET — Reset control

A reset in the system is triggered by either a system-level or core-level reset source.

A system-level reset resets all cores. Power-on reset, brownout reset, and pin reset are examples of a system-level reset. A core-level reset, such as a soft reset or a lockup, resets either the entire core or only part of it. The different reset sources in the system are illustrated in the following figure.

Figure 17: Reset sources

After a system-level reset, the application core starts up on its own. The network core is not automatically started, but can be started by the application core CPU, see [Network Force-OFF](#) on page 67.

After a reset occurs, the register [RESETREAS](#) on page 70 can be read to determine which source generated the reset. Each core has its own [RESETREAS](#) register. System-level and application core reset sources are also available in the network core's [RESETREAS](#) register, unless otherwise noted.

### 4.10.1 Power-on reset

The power-on reset (POR) generator initializes the system when the VDD supply voltage is above the power-on threshold. This also applies in high voltage mode, where the VDD supply voltage is provided by the high voltage regulator (VREGH).

The system is held in a reset state until the supply has reached the minimum operating voltage, and the internal voltage regulators have started. After a power-on reset, the application core is started while the network core is held in reset, see [Network Force-OFF](#) on page 67.

### 4.10.2 Pin reset

A pin reset is generated when the physical reset pin on the device is asserted.

Similar to a power-on reset, the application core is started after the reset pin is deasserted. The network core is held in reset, see [Network Force-OFF](#) on page 67.

The reset pin has an internal pull-up resistor with the same resistance as GPIO pull-ups, see [GPIO — General purpose input/output](#) on page 293.

### 4.10.3 Brownout reset

The brownout reset (BOR) generator puts the system in reset state if the VDD supply voltage drops below the brownout reset threshold. This also applies in high voltage mode, where the VDD supply voltage is provided by the high voltage regulator (VREGH).

Similar to a power-on reset, the application core is started after BOR is deasserted while the network core is held in reset, see [Network Force-OFF](#) on page 67.

### 4.10.4 Wakeup from System OFF mode reset

The device is reset when it wakes up from System OFF mode.

Similar to a power-on reset, the application core is started while the network core is held in reset, see [Network Force-OFF](#) on page 67.

If the device is in Debug Interface mode, the debug access port (DAP) is not reset after a wakeup from System OFF. For more information, see [Debug and trace](#) on page 813.

### 4.10.5 Soft reset

Soft reset is generated when the SYSRESETREQ bit of the application interrupt and reset control register (AIRCR) in the Arm core is set. For more information, see [Arm documentation](#).

When the application core performs a soft reset, the network core is held in reset, see [Network Force-OFF](#) on page 67. A soft reset in the network core will only cause the network core to reset.

A soft reset can also be generated using the [RESET](#) on page 830 register in the associated CTRL-AP.

### 4.10.6 Watchdog timer reset

A watchdog timer (WDT) reset is generated when the watchdog timer times out.

Each core has its own WDT instance. When the application core gets a WDT reset, the network core is held in reset, see [Network Force-OFF](#) on page 67. A WDT reset in the network core will only cause the network core to reset. The reset target depends on the core where WDT is instantiated.

**Note:** Because the network core WDT reset is local for the network core, the application core is not aware of WDT timing out in the network core. Notifying the application core is possible. One way is to check the register [RESETREAS](#) on page 70 for WDT flags and report the error through inter-processor communication (IPC).

For more information about WDT, see [WDT — Watchdog timer](#) on page 805. More information about IPC is available in [IPC — Interprocessor communication](#) on page 337.

#### 4.10.7 Network Force-OFF

The application core can force the network core off.

The application core can hold the network core in Force-OFF mode, using register [NETWORK.FORCEOFF](#) on page 71.

Application core resets implicitly result in the network core being held in Force-OFF. The network core will be held in Force-OFF until the application core releases it using the [NETWORK.FORCEOFF](#) register.

For details on how to use this mode, see [Force-OFF mode](#) on page 27.

#### 4.10.8 Retained registers

A retained register is one that retains its value in System OFF and/or Force-OFF modes and when reset, depending on the reset source. See individual peripheral chapters for information about which registers are retained for the various peripherals.

#### 4.10.9 Application core reset behavior

Application core reset behavior depends on the reset source.

Any reset in the application core will cause a network core Force-OFF, triggering the FORCEOFF reset source in the network core. For more information, see [Network Force-OFF](#) on page 67.

In System OFF mode, the watchdog timer is not running and there is no CPU lockup possible. RAM may be fully or partially retained, depending on RAM retention settings in [VMC — Volatile memory controller](#) on page 802.

If the device is in Debug Interface mode, the debug components will not be reset. Additionally, CPU lockup will not generate a reset. See [Debug and trace](#) on page 813 for more information about the different debug components in the system.

Application core reset targets and their reset sources are summarized in the following table.

An 'x' in the table means that the specific module is reset.

| Reset source                      | Reset target |              |       |                |     |           |
|-----------------------------------|--------------|--------------|-------|----------------|-----|-----------|
|                                   | CPU          | Network core | Debug | RAM            | WDT | RESETREAS |
| CPU lockup                        | x            | x            |       |                |     |           |
| Soft reset                        | x            | x            |       |                |     |           |
| Wakeup from System OFF mode reset | x            | x            | x     | x <sup>3</sup> | x   |           |
| Watchdog timer reset              | x            | x            | x     | x              | x   |           |
| Pin reset                         | x            | x            | x     | x              | x   |           |
| Brownout reset                    | x            | x            | x     | x              | x   | x         |
| Power-on reset                    | x            | x            | x     | x              | x   | x         |
| NETWORK.FORCEOFF                  |              | x            |       |                |     |           |

Table 8: Application core reset targets and their reset sources

**Note:** RAM is never reset, but depending on the reset source, its content may be corrupted.

Some retained registers may have a different reset behavior, as shown in the following table.

An 'x' in the table means that the specific module is reset.

| Reset source                      | Reset target                 |     |                |                         |                |
|-----------------------------------|------------------------------|-----|----------------|-------------------------|----------------|
|                                   | Regular peripheral registers | SPU | GPIO           | REGULATORS, OSCILLATORS | POWER-GPREGRET |
| CPU lockup                        | x                            | x   | x <sup>4</sup> |                         |                |
| Soft reset                        | x                            | x   | x <sup>4</sup> |                         |                |
| Wakeup from System OFF mode reset | x                            |     |                |                         |                |
| Watchdog timer reset              | x                            | x   | x              | x                       |                |
| Pin reset                         | x                            | x   | x              | x                       |                |
| Brownout reset                    | x                            | x   | x              | x                       | x              |
| Power-on reset                    | x                            | x   | x              | x                       | x              |

Table 9: Application core reset behavior for retained registers

#### 4.10.10 Network core reset behavior

Network core reset behavior depends on the reset source.

In System OFF mode, or when the network core is held in Force-OFF, the watchdog timer is not running and there is no CPU lockup possible. RAM may be fully or partially retained, depending on RAM retention settings in [VMC — Volatile memory controller](#) on page 802.

If the device is in Debug Interface mode, the debug components will not be reset. Additionally, CPU lockup will not generate a reset. See [Debug and trace](#) on page 813 for more information about the different debug components in the system.

Any reset in the application core will cause a network core force off, triggering the network FORCEOFF reset source in the following table. For more information, see [Network Force-OFF](#) on page 67.

<sup>3</sup> Depending on RAM retention settings.

<sup>4</sup> Except MCUSEL field, the MCUSEL register of the GPIO peripheral is not reset for CPU lockup and Soft reset.

An 'x' in the table means that the specific module is reset. Pin reset, brownout reset, and power-on reset are system level reset sources with the network core and application core having the same behavior, see [Application core reset behavior](#) on page 67.

| Reset source                     | Reset target |                |     |           |
|----------------------------------|--------------|----------------|-----|-----------|
|                                  | CPU          | RAM            | WDT | RESETREAS |
| CPU lockup                       | x            |                |     |           |
| Soft reset                       | x            |                |     |           |
| Network FORCEOFF                 | x            | x <sup>5</sup> | x   |           |
| Application Watchdog timer reset | x            | x              | x   |           |
| Local Watchdog timer reset       | x            | x              | x   |           |

Table 10: Network core reset target sources

**Note:** RAM is never reset, but its content may be corrupted depending on the reset source.

Some retained registers may have a different reset behavior, as shown in following table.

An 'x' in the table means that the specific module is reset. Pin reset, brownout reset, and power-on reset are system level reset sources with the network core and application core having the same behavior, see [Application core reset behavior](#) on page 67.

| Reset source                     | Reset target                 |                |                 |
|----------------------------------|------------------------------|----------------|-----------------|
|                                  | Regular peripheral registers | GPIO           | POWER.-GPREGRET |
| CPU lockup                       | x                            | x <sup>6</sup> |                 |
| Soft reset                       | x                            | x <sup>6</sup> |                 |
| Network FORCEOFF                 | x                            |                |                 |
| Application Watchdog timer reset | x                            | x              |                 |
| Local Watchdog timer reset       | x                            | x              |                 |

Table 11: Network core reset behavior for retained registers

<sup>5</sup> Depending on RAM retention settings.

<sup>6</sup> MCUSEL settings are kept.

## 4.10.11 Registers

### Instances

| Instance   | Domain      | Base address | TrustZone |     |     | Split access | Description              |
|------------|-------------|--------------|-----------|-----|-----|--------------|--------------------------|
|            |             |              | Map       | Att | DMA |              |                          |
| RESET : S  | APPLICATION | 0x50005000   | US        | S   | NA  | No           | Reset control and status |
| RESET : NS |             | 0x40005000   |           |     |     |              |                          |
| RESET      | NETWORK     | 0x41005000   | HF        | NS  | NA  | No           | Reset status             |

### Configuration

| Instance   | Domain      | Configuration                                                 |
|------------|-------------|---------------------------------------------------------------|
| RESET : S  | APPLICATION | Not supported: LSREQ, LLOCKUP, LDOG, MRST, MFORCEOFF, LCTRLAP |
| RESET : NS |             |                                                               |
| RESET      | NETWORK     | Not supported: NETWORK.FORCEOFF                               |

### Register overview

| Register         | Offset | TZ | Description            |
|------------------|--------|----|------------------------|
| RESETREAS        | 0x400  |    | Reset reason           |
| NETWORK.FORCEOFF | 0x614  |    | Force network core off |

#### 4.10.11.1 RESETREAS

Address offset: 0x400

Reset reason

Unless cleared, the RESETREAS register will be cumulative. A field is cleared by writing 1 to it. Multiple fields can be cleared at the same time by writing a value with several of the fields set to 1.

| Bit number       |     |          | 31          | 30    | 29 | 28           | 27 | 26 | 25    | 24 | 23 | 22 | 21 | 20 | 19              | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |

## 4.10.12 Electrical specification

### 4.10.12.1 Application core startup times

| Symbol                         | Description                                                                                             | Min. | Typ.                                 | Max. | Units   |
|--------------------------------|---------------------------------------------------------------------------------------------------------|------|--------------------------------------|------|---------|
| t <sub>POR</sub>               | Time in power-on reset after supply reaches minimum operating voltage, depending on supply rise time.   | ..   | ..                                   | ..   |         |
| t <sub>POR,10us</sub>          | VDD rise time 10 $\mu$ s                                                                                |      | 0.7                                  | 1.0  | ms      |
| t <sub>POR,10ms</sub>          | VDD rise time > 10 ms                                                                                   |      | 0                                    |      | ms      |
| t <sub>PINR</sub>              | Reset time when using pin reset, depending on pin capacitance                                           | ..   | ..                                   | ..   |         |
| t <sub>PINR,500nF</sub>        | 500 nF capacitance at reset pin                                                                         |      | 13                                   | 40   | ms      |
| t <sub>PINR,10uF</sub>         | 10 $\mu$ F capacitance at reset pin                                                                     |      | 260                                  | 800  | ms      |
| t <sub>R2ON</sub>              | Time from reset to ON (CPU execute)                                                                     |      | t <sub>POR</sub> + t <sub>PINR</sub> |      |         |
| t <sub>OFF2ON,NM</sub>         | Time from OFF to CPU execute when in normal voltage mode (supply on VDD)                                |      | 38                                   |      | $\mu$ s |
| t <sub>OFF2ON,LDO,HV</sub>     | Time from OFF to CPU execute when in high voltage mode (supply on VDDH) and VREGH using LDO regulator   |      | 38                                   |      | $\mu$ s |
| t <sub>OFF2ON,DCDC,HV</sub>    | Time from OFF to CPU execute when in high voltage mode (supply on VDDH) and VREGH using DC/DC regulator |      | 38                                   |      | $\mu$ s |
| t <sub>IDLE2CPU</sub>          | Time from IDLE to CPU execute                                                                           |      | 23                                   |      | $\mu$ s |
| t <sub>IDLE2CPU,CONSTLAT</sub> | Time from IDLE to CPU execute in constant latency submode                                               |      | 10                                   |      | $\mu$ s |
| t <sub>EVTSET,CL1</sub>        | Time from HW event to PPI event in Constant Latency System ON mode                                      |      | 62.5                                 |      | ns      |
| t <sub>EVTSET,CL0</sub>        | Time from HW event to PPI event in Low-Power System ON mode                                             |      | 62.5                                 |      | ns      |

### 4.10.12.2 Network core startup times

| Symbol                             | Description                                                                      | Min. | Typ. | Max. | Units   |
|------------------------------------|----------------------------------------------------------------------------------|------|------|------|---------|
| t <sub>NET,EVTSET,CL1</sub>        | Time from HW event to PPI event in Constant Latency System ON mode               |      | 62.5 |      | ns      |
| t <sub>NET,EVTSET,CL0</sub>        | Time from HW event to PPI event in Low-Power System ON mode                      |      | 62.5 |      | ns      |
| t <sub>NET,IDLE2CPU</sub>          | Time from IDLE to CPU execute                                                    |      | 15   |      | $\mu$ s |
| t <sub>NET,IDLE2CPU,CONSTLAT</sub> | Time from IDLE to CPU execute in constant latency submode                        |      | 7    |      | $\mu$ s |
| t <sub>FO2ON,NET64</sub>           | Time for network core from OFF to CPU execute after NETWORK.FORCEOFF is released |      | 20   |      | $\mu$ s |

## 4.11 CLOCK — Clock control

The clock control system can source the system clocks from a range of internal or external high and low frequency oscillators, and distribute them to peripherals and modules based on their individual requirements. Clock distribution is automated and grouped independently by module to limit current consumption in unused branches of the clock tree.

Each core subsystem has its own clock control system that is responsible for requesting resources from the power and clock subsystem.

Figure 18: Clock control

The power and clock subsystem secures glitch-free switching from one clock source to another. This applies to all clock sources.

**Note:** Registers [INTEN](#) on page 88, [INTENSET](#) on page 89, and [INTENCLR](#) on page 89 are the same registers (at the same address) as the corresponding registers in POWER.

#### 4.11.1 HFCLK controller

Each core has a number of high frequency clock (HFCLK) control instances. Each instance distributes one or more clocks to the core.

The following table lists the core clocks that are available.

| Core clock | Description                                             |
|------------|---------------------------------------------------------|
| HCLK128M   | Scalable 128 MHz CPU clock for the application core     |
| HCLK64M    | 64 MHz CPU clock for the network core                   |
| PCLK192M   | Scalable 192 MHz clock for QSPI                         |
| PCLK64M    | 64 MHz peripheral clock                                 |
| PCLK48M    | 48 MHz clock for USB                                    |
| PCLK32M    | 32 MHz peripheral clock                                 |
| PCLK16M    | 16 MHz peripheral clock                                 |
| PCLK1M     | 1 MHz peripheral clock                                  |
| ACLK       | 11.289 MHz or 12.288 MHz tunable audio peripheral clock |

Table 12: Core clocks

The HFCLK clocks sourced from the power and clock subsystem to the HFCLK control instances are the following:

| HFCLK clock | Description         |
|-------------|---------------------|
| HFCLK128M   | 128 MHz HFCLK clock |
| HFCLK64M    | 64 MHz HFCLK clock  |
| HFCLK192M   | 192 MHz HFCLK clock |
| HFCLKAUDIO  | Audio HFCLK clock   |

Table 13: HFCLK clocks for HFCLK control instances

In order to generate the HFCLK clocks, the following HFCLK sources are available:

- 192 MHz/128 MHz/64 MHz internal oscillator (HFINT)
- 32 MHz crystal oscillator (HFXO), optionally using built-in capacitors as described in [OSCILLATORS — Oscillator control](#) on page 98

See [Clock control](#) on page 73 for more information.

CPU, peripherals, and other system components within a core will automatically request clocks from its corresponding local HFCLK control. The HFCLK control passes the request to the power and clock subsystem and, once the clocks are running, distributes them to the components within the core.

When HFCLK control requests within a core are stopped, the HFCLK control will stop requesting clock from the power and clock subsystem. For example, when the CPU enters sleep or when peripherals have completed their tasks. If there are no HFCLK control requests from any core, the power and clock subsystem will automatically stop the clock.

When the system enters System ON mode, and a HFCLK clock is requested, the relevant HFINT will be used as the HFCLK source. When requests for the clock are stopped, the HFINT will automatically stop.

HFCLK clocks are only available to the HFCLK controllers when the system is in System ON mode.

It is possible to have a HFCLK source running before being started by the relevant clock request (for instance, the HFCLK source is kept running during sleep). This gives shorter start-up time but causes increased power consumption. Starting the HFXO is needed when crystal clock accuracy is required.

The HFCLK source selected in register [HFCLKSRC](#) on page 93 is started by triggering the [HFCLKSTART](#) task.

The source for the HFCLK128M/HFCLK64M clocks can be configured at any time (for instance, when the HFCLK has already been started). The content of the [HFCLKSRC](#) register only takes effect when the [HFCLKSTART](#) task is triggered.

The event [HFCLKSTARTED](#) is generated when the [HFCLKSTART](#) task is triggered, the oscillator is started, and the frequency is stabilized.

The HFCLK source selected in register [HFCLK192MSRC](#) on page 96 is started by triggering the [HFCLK192MSTART](#) task.

The source for the HFCLK192M clock can be configured at any time (for instance, when the HFCLK has already been started). The content of the [HFCLK192MSRC](#) register only takes effect when the [HFCLK192MSTART](#) task is triggered.

The event [HFCLK192MSTARTED](#) is generated when the [HFCLK192MSTART](#) task is triggered, the oscillator is started, and the frequency stabilized.

HFCLKAUDIO requires HFXO, so when triggering the [HFCLKAUDIOSTART](#) task, this always starts the HFXO.

The event [HFCLKAUDIOSTARTED](#) is generated when the [HFCLKAUDIOSTART](#) task is triggered, the oscillator is started, and the frequency stabilized.

It is possible to trigger a new START task after one has already been triggered, and before the corresponding STARTED event is generated. In this case, only one STARTED event will be generated, corresponding to the last triggered START task. Triggering a START task after the STARTED event from a previous triggered START task is generated, will generate a new STARTED event.

Time from a START task to the corresponding STARTED event may differ depending on whether the HFCLK source is already running or in the process of starting. The amount of time before a STARTED event may vary when a different HFCLK source is configured before triggering a new START task.

When the clock control system switches from HFINT source to HFXO source, the HFXO becomes active. The startup time is programmable, enabling the use of different types of crystal oscillators (e.g. standard crystals that may have different startup times). The HFXO startup time is given as the sum of the following:

- HFXO power-up time, as specified in [32 MHz crystal oscillator \(HFXO\)](#) on page 102.
- HFXO count time, as specified in [HFXOCNT](#) on page 130.

The HFXO must be selected and started in order to do the following:

- Use RADIO
  - The network domain [HFCLKSTART](#) task is used
- Enable USB to respond to USB traffic
  - The application domain [HFCLK192MSTART](#) is used
- Set NFCT to activated state
  - The application domain [HFCLKSTART](#) task is used
- Improve SAADC performance by reducing clock jitter
  - The application domain [HFCLKSTART](#) task is used

Each HFCLK control can request the HFXO source independently from one another via the corresponding START task. This ensures that each core and peripheral will have access to a high accuracy clock when needed. Core clocks that originate from the same HFCLK clock will also have the same HFCLK source. This means that parts of the core that have not requested the HFXO may get a clock that is more accurate than expected, but not the other way around.

All cores that have requested a HFCLK source to start by triggering a START task must also request it to stop by triggering the corresponding STOP task (see [HFCLKSTOP](#), [HFCLK192MSTOP](#), and [HFCLKAUDIOSTOP](#) tasks) before the power and clock subsystem will stop it.

HFCLK source(s) will stop when all corresponding STOP tasks have been triggered and there are no requests for HFCLK clock(s) from the system.

Triggering a HFCLK STOP task is required only if the corresponding HFCLK START task has been triggered before. When a HFCLK START task is triggered, it is possible to trigger again the same HFCLK START task without triggering the corresponding HFCLK STOP task in between.

#### 4.11.1.1 Application core frequency scaling

The application core clocks can be scaled from their respective HFCLK clocks.

The application core clock HCLK128M can at any time be scaled from the HFCLK128M clock using the [HFCLKCTRL](#) register.

The HCLK192M clock can be scaled from the HFCLK192M clock using the [HFCLK192MCTRL](#) register.

**Note:** Settings Div1 and Div2 in [HFCLK192MCTRL](#) register will result in increased power consumption.

The ACLK audio clock cannot be scaled from the HFCLKAUDIO clock. Instead, its frequency can be configured in the relevant peripherals. Refer to [Audio oscillator](#) on page 76 for more information on audio clock and related peripherals.

**Note:** It is possible to scale the application core clocks at any time, for instance when a clock has already been started, without having to stop it first.

#### 4.11.1.2 32 MHz crystal oscillator (HFXO)

The 32 MHz crystal oscillator (HFXO) is controlled by a 32 MHz external crystal, see [OSCILLATORS — Oscillator control](#) on page 98.

#### 4.11.1.3 Audio oscillator

The audio oscillator generates clock frequencies suitable for audio applications.

The audio oscillator has the following features:

- Adjustable frequency with 3.3 ppm resolution in two frequency bands - 11.176 MHz to 11.402 MHz, and 12.165 MHz to 12.411 MHz
- Low jitter, suitable for audio applications
- Always uses the HFXO

The HFCLKAUDIO clock generated by the audio oscillator is suitable for use as the source clock in the I<sup>2</sup>S and PDM audio peripherals. In order to use this clock, it must be selected in the corresponding configuration registers in these peripherals. It is required to trigger the [HFCLKAUDIOSTART](#) task before it is used. To stop the HFCLKAUDIO clock, the [HFCLKAUDIOSTOP](#) task must be triggered. After triggering this task, the oscillator will be kept running as long as a peripheral is using it.

In applications where the audio data is arriving asynchronously to on-chip clocks, the frequency can be adjusted to stay in sync with the sender. The frequency can be configured in register [HFCLKAUDIO.FREQUENCY](#) on page 94 using one of the following equations.

$$f_{out} = \frac{32M}{12} (4 + HFCLKAUDIO.FREQUENCY \cdot 2^{-16})$$

Figure 19: Calculating audio frequency  $f_{out}$  from register value

$$HFCLKAUDIO.FREQUENCY = 2^{16} \left( \frac{12 \cdot f_{out}}{32M} - 4 \right)$$

Figure 20: Calculating register value from audio frequency  $f_{out}$

The acceptable [HFCLKAUDIO.FREQUENCY](#) register value ranges for the two frequency bands are listed in the following table.

When switching between the two frequency ranges, the peripherals must be stopped.

| Frequency band           | Register value and frequency |                       |                       |
|--------------------------|------------------------------|-----------------------|-----------------------|
|                          | Min                          | Center                | Max                   |
| 11.176 MHz to 11.402 MHz | 12519<br>(11.176 MHz)        | 15298<br>(11.289 MHz) | 18068<br>(11.402 MHz) |
| 12.165 MHz to 12.411 MHz | 36834<br>(12.165 MHz)        | 39846<br>(12.288 MHz) | 42874<br>(12.411 MHz) |

Table 14: HFCLKAUDIO.FREQUENCY register ranges

#### 4.11.1.4 Overriding the automatic HFCLK control system

Overriding the automatic clock control system is possible to ensure a HFCLK clock is started and kept running, even if not requested.

This can be used to avoid associated HFCLK clock start-up times and have the highest clock accuracy after wake-up from sleep.

The register [HFCLKALWAYSRUN](#) on page 95 can override the automatic clock control system for the HFCLK128M/HFCLK64M clocks. This override is initiated by performing the following steps:

1. Set [HFCLKSRC.SRC](#) to select the HFCLK source.
2. Set [HFCLKALWAYSRUN.ALWAYSRUN](#).
3. Trigger the [HFCLKSTART](#) task.

The register [HFCLK192MALWAYSRUN](#) on page 96 can override the automatic clock control system for the HFCLK192M clock. This override is initiated by performing the following steps:

1. Set [HFCLK192MSRC.SRC](#) to select the HFCLK source.
2. Set [HFCLK192MALWAYSRUN.ALWAYSRUN](#).
3. Trigger the [HFCLK192MSTART](#) task.

Registers [HFCLKSRC/HFCLK192MSRC](#) and [HFCLKALWAYSRUN/HFCLK192MALWAYSRUN](#) can be written at any time, but are only activated by the START task.

The register [HFCLKAUDIOALWAYSRUN](#) on page 95 can override the automatic clock control system for the HFCLKAUDIO clock. The override is initiated by performing the following steps:

1. Set [HFCLKAUDIOALWAYSRUN.ALWAYSRUN](#).
2. Trigger the [HFCLKAUDIOSTART](#) task.

**Note:** In this case, the HFCLK source is always the HFXO.

Register [HFCLKAUDIOALWAYSRUN](#) can be written at any time, but is only activated by the START task.

#### 4.11.2 LFCLK controller

Each core has a number of low frequency clock (LFCLK) control instances. Each instance distributes one or more clocks to the core.

The LFCLK control instance in each core distributes the 32.768 kHz PCLK32KI peripheral clock to its corresponding core. The LFCLK clock is sourced from the power and clock subsystem to each LFCLK control instance.

In order to generate the LFCLK clock, the LFCLK controller uses the following LFCLK sources:

- 32.768 kHz RC oscillator (LFRC)
- 32.768 kHz crystal oscillator (LFXO)
- 32.768 kHz synthesized from HFCLK (LFSYNT)

For an illustration of the clock sources, see [Clock control](#) on page 73.

The LFCLK controller and all LFCLK sources are switched off in System OFF mode.

When peripherals require the PCLK32KI clock, such as [RTC — Real-time counter](#) on page 572 and [WDT — Watchdog timer](#) on page 805, the LFCLK control will automatically request the LFCLK clock to the power and clock subsystem. The default LFCLK source is the LFRC.

When LFCLK control requests are stopped, LFCLK will stop requesting clock from the power and clock subsystem. If there are no LFCLK control requests from other cores, the power and clock subsystem will automatically stop the LFCLK clock and the LFRC source.

The LFCLK source may also be started by triggering the **LFCLKSTART** task. The LFCLK source is configured by selecting the preferred LFCLK source in register **LFCLKSRC** on page 94. Once selected, the LFCLK source will be started by triggering the **LFCLKSTART** task.

The LFCLK source can be configured at any time (for instance, when the LFCLK has already been started). The content of the **LFCLKSRC** register only takes effect when the **LFCLKSTART** task is triggered.

**Note:** Automatic requests of the LFCLK clock will ignore the value in **LFCLKSRC** and use **LFRC** as source, unless the LFCLK source is started by triggering the **LFCLKSTART** start. In this case, the LFCLK source will correspond to the value in **LFCLKSRC** when the **LFCLKSTART** start was last triggered.

The **LFCLKSTARTED** event will be generated after the **LFCLKSTART** task has been triggered and the LFCLK source has started. Triggering a **LFCLKSTART** task before the **LFCLKSTARTED** event from a previous **LFCLKSTART** task is generated will only generate one **LFCLKSTARTED** event. Triggering a **LFCLKSTART** task after a **LFCLKSTARTED** event is generated will generate a new **LFCLKSTARTED** event.

The LFCLK clock is stopped when nothing requests it, e.g. **RTC — Real-time counter** on page 572 and **WDT — Watchdog timer** on page 805 are stopped, and the **LFCLKSTOP** task is triggered. This must be done for all cores. Triggering the **LFCLKSTOP** task is required only if the **LFCLKSTART** task has been triggered before.

When the **LFCLKSTART** task is triggered, it is possible to trigger a new **LFCLKSTART** task without triggering a **LFCLKSTOP** task in between.

If the **LFXO** is selected as the LFCLK source, the LFCLK clock will initially start running from the **LFRC** while the **LFXO** is starting up, and then automatically switch to using the **LFXO** once this oscillator is running.

Events will be generated in the correct order, even if an LFCLK source that is already started by another LFCLK control instance is requested. The timing of events may differ, depending on whether a LFCLK source is already running or in the process of starting.

If two instances of the LFCLK control system request different LFCLK sources, the power and clock subsystem will secure that the most accurate of the requested LFCLK sources is selected. If one LFCLK control instance requests a particular LFCLK source to stop when another LFCLK control instance (or a peripheral) requests the same source to run, but at a lower accuracy, the power and clock subsystem will switch to the less accurate source. The following table summarizes the priorities of the LFCLK sources.

| Priority       | LFCLK source |
|----------------|--------------|
| Highest        | LFSYNT       |
| Second highest | LFXO         |
| Lowest         | LFRC         |

Table 15: LFCLK request priority

When switching the LFCLK source, such as from **LFRC** to **LFXO**, up to one LFCLK cycle may be lost.

#### 4.11.2.1 32.768 kHz RC oscillator (LFRC)

An internal 32.768 kHz RC oscillator (**LFRC**) is available as the LFCLK source.

The **LFRC** oscillator is fully embedded in **nRF5340** and does not require additional external components.

##### 4.11.2.1.1 Calibrating the 32.768 kHz RC oscillator

To improve accuracy of the **LFRC** oscillator, it can be calibrated using the **HFXO** as a reference oscillator.

The **LFRC** oscillator can be calibrated while it is running. The calibration is started by triggering the **CAL** task which temporarily requests the **HFCLK** with the **HFXO** as the source for calibration.

A **DONE** event will be generated when the calibration is finished.

**Note:** Any core changing the LFCLK source will abort calibration without the **DONE** event being generated in the core triggering the **CAL** task.

If the **CAL** task is triggered while a calibration routine is already running (i.e. before the **DONE** event is generated), the **CAL** task has no effect and the calibration continues.

All cores can trigger the **CAL** task independently of each other. As a result, each core will receive a corresponding **DONE** event. If the calibration routine is already running (i.e. a core has triggered the **CAL** task), and the **CAL** task is triggered from another core, a **DONE** event is generated in both cores when the calibration of its corresponding LFRC oscillator is complete.

#### 4.11.2.2 32.768 kHz crystal oscillator (LFXO)

For higher LFCLK accuracy (when greater than  $\pm 250$  ppm accuracy is required), the low frequency crystal oscillator (LFXO) must be used.

This clock source requires external components and GPIO pin configuration, see **OSCILLATORS — Oscillator control** on page 98.

#### 4.11.2.3 32.768 kHz synthesized from HFCLK (LFSYNT)

The LFCLK can be synthesized from the HFCLK clock source.

LFSYNTH depends on the HFCLK to run. The accuracy of the LFCLK clock with the LFSYNTH as a source assumes the accuracy of the HFCLK. If high accuracy is required, the HFCLK must be generated from the HFXO.

Using the LFSYNT clock removes the requirement for an external 32.768 kHz crystal, but increases average power consumption as the HFCLK will need to be requested in the system.

#### 4.11.2.4 Overriding the automatic LFCLK control system

Overriding the automatic clock control system to ensure the LFCLK clock is started and kept running is possible, even if not requested.

This can be used to avoid associated LFCLK clock start-up times and have the highest clock accuracy after wake-up from sleep.

The register **LFCLKALWAYSRUN** on page 95 can override the automatic clock control system. This override is initiated by performing the following steps:

1. Set **LFCLKSRC.SRC** to select the LFCLK source.
2. Set **LFCLKALWAYSRUN.ALWAYSRUN**.
3. Trigger the **LFCLKSTART** task.

Registers **LFCLKSRC.SRC** and **LFCLKALWAYSRUN.ALWAYSRUN** can be written at any time, but are only activated by the **LFCLKSTART** task.

### 4.11.3 Registers

#### Instances

| Instance   | Domain      | Base address | TrustZone |     |     | Split<br>access | Description   |
|------------|-------------|--------------|-----------|-----|-----|-----------------|---------------|
|            |             |              | Map       | Att | DMA |                 |               |
| CLOCK : S  | APPLICATION | 0x50005000   | US        | S   | NA  | No              | Clock control |
| CLOCK : NS |             | 0x40005000   |           |     |     |                 |               |

#### 4.11.3.50 HFCLK192MALWAYSRUN

Address offset: 0x584

Automatic or manual control of HFCLK192M

The AlwaysRun setting will ensure the clock source is always running, independent of the automatic clock request system.

**Note:** This setting is activated by triggering the HFCLK192MSTART task.

## 4.12 OSCILLATORS — Oscillator control

The system oscillators are shared between the cores in the system and automatically controlled by the clock control system, see [CLOCK — Clock control](#) on page 72.

The system has the following crystal oscillators:

- High-frequency 32 MHz crystal oscillator (HFXO)
- Low-frequency 32.768 kHz crystal oscillator (LFXO)

The crystal oscillators can be configured to use either built-in or external capacitors.

### 4.12.1 High-frequency (32 MHz) crystal oscillator (HFXO)

The high-frequency crystal oscillator (HFXO) is controlled by a 32 MHz external crystal.

The crystal oscillator is designed for use with an AT-cut quartz crystal in parallel resonant mode, connected between pins XC1 and XC2. To achieve correct oscillation frequency, the load capacitance must match the specification in the crystal data sheet. The following figure shows how the 32 MHz crystal is connected to the high frequency crystal oscillator.

Figure 21: Circuit diagram of the high-frequency crystal oscillator

The load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is calculated by the following equation.

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

Figure 22: Load capacitance equation

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground. For more information, see [Reference circuitry](#) on page 863.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitance on the PCB.  $C_{pin}$  is the pin input capacitance on pins XC1 and XC2. See table [32 MHz crystal oscillator \(HFXO\)](#) on page 102. The load capacitors C1 and C2 should have the same value.

For reliable operation, the crystal load capacitance, shunt capacitance, equivalent series resistance, and drive level must comply with the specifications in table [32 MHz crystal oscillator \(HFXO\)](#) on page 102. It

is recommended to use a crystal with lower than maximum load capacitance and/or shunt capacitance. A low load capacitance will reduce both startup time and current consumption.

#### 4.12.1.1 Using internal capacitors

Optional internal capacitors ranging from 7.0 pF to 20.0 pF in 0.5 pF steps, are provided on pins XC1 and XC2.

Enabling internal capacitors eliminates the need for external capacitors for the 32 MHz crystal. The configuration of the internal capacitors must take place before starting the high-frequency crystal oscillator (HFXO).

The internal capacitors are used instead of the external capacitors C1 and C2, and the total capacitance seen by the crystal across its terminals is calculated by the load capacitance equation in [High-frequency \(32 MHz\) crystal oscillator \(HFXO\)](#) on page 98.

To enable the internal capacitors, find the correct `XOSC32MCAPS.CAPVALUE` field using the following equation.

```
CAPVALUE = (((FICR->XOSC32MTRIM.SLOPE+56) * (CAPACITANCE*2-14))
             + ((FICR->XOSC32MTRIM.OFFSET-8) <<4) +32) >>6;
```

The equation has the following variables

- `CAPACITANCE` is the desired capacitor value in pF, holding any value between 7.0 pF and 20.0 pF in 0.5 pF steps.
- `FICR->XOSC32MTRIM` are factory trim values which usually are different from device to device.

Finally, set `XOSC32MCAPS.ENABLE` to `Enabled`, to activate the capacitors.

After this, when HFXO is started, it will use the internal capacitor values together with the external crystal.

**Note:** It is possible to avoid using floating point numbers by pre-calculating the  $(CAPACITANCE * 2 - 14)$  field of the above equation.

#### 4.12.2 Low-frequency (32.768 kHz) crystal oscillator (LFXO)

For higher LFCLK accuracy (when greater than  $\pm 250$  ppm accuracy is required), the 32.768 kHz crystal oscillator (LFXO) must be used.

To use the LFXO, a 32.768 kHz crystal must be connected between the XL1 and XL2 pins, as illustrated in the following figure.

Figure 23: Circuit diagram of the low-frequency crystal oscillator

To enable oscillator functionality on XL1 and XL2 pins, use value *Peripheral* for the MCUSEL bitfield of the register `PIN_CNF[n]` ( $n=0..31$ ) ([Retained](#)) on page 302.

To achieve correct oscillation frequency, the load capacitance (CL) must match the specification in the crystal data sheet. The load capacitance (CL) is the total capacitance seen by the crystal across its terminals. It is calculated by the following equation.

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

Figure 24: Load capacitance equation

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground.  $C_{pcb1}$  and  $C_{pcb2}$  are stray capacitance on the PCB.  $C_{pin}$  is the pin input capacitance on the XL1 and XL2 pins (see [32.768 kHz crystal oscillator \(LFXO\)](#) on page 103). The load capacitors C1 and C2 should have the same value.

For more information, see [Reference circuitry](#) on page 863.

#### 4.12.2.1 Using internal capacitors

Optional internal capacitors of 6 pF, 7 pF, and 9 pF are provided between pins XL1 and XL2.

Enabling the internal capacitor between XL1 and XL2 pins eliminates the need for external capacitors for the 32 kHz crystal, as shown in the following figure.

Figure 25: Internal capacitor for the 32 kHz crystal

To enable this capacitor, choose the correct  $C_{INT}$  capacitance in register [XOSC32KI.INTCAP](#). The value of the internal capacitor  $C_{INT}$  must match the specification in the crystal data sheet.  $C_{INT}$  is the capacitance seen by the crystal across its terminals, including pin capacitance but excluding PCB stray capacitance.

#### 4.12.3 Low-frequency (32.768 kHz) external source

The 32.768 kHz crystal oscillator (LFXO) is designed to work with external sources.

The following external sources are supported:

- A low swing clock. The signal should be applied to the XL1 pin with the XL2 pin grounded. Set [OSCILLATORS.XOSC32KI.BYPASS](#)=Disabled.
- A rail-to-rail clock. The signal should be applied to the XL1 pin with the XL2 pin left unconnected. Set [OSCILLATORS.XOSC32KI.BYPASS](#)=Enabled.

In order to use an external source, configure [LFCLKSRC.SRC](#)=LFXO.

## 4.12.4 Registers

### Instances

| Instance         | Domain      | Base address | TrustZone |     |     | Split access | Description              |

## 4.12.5 Electrical specification

### 4.12.5.1 32 MHz crystal oscillator (HFXO)

| Symbol                          | Description                                                                                                                                                                                                         | Min. | Typ. | Max. | Units |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|-------|
| $f_{\text{HFXO}}$               | External crystal frequency                                                                                                                                                                                          |      | 32   |      | MHz   |
| $f_{\text{TOL\_HFXO}}$          | Frequency tolerance requirement for 2.4 GHz proprietary radio applications                                                                                                                                          |      |      | ±60  | ppm   |
| $f_{\text{TOL\_HFXO\_BLE}}$     | Frequency tolerance requirement, Bluetooth Low Energy applications, packet length ≤ 200 bytes                                                                                                                       |      |      | ±40  | ppm   |
| $f_{\text{TOL\_HFXO\_BLE\_LP}}$ | Frequency tolerance requirement, Bluetooth Low Energy applications, packet length > 200 bytes                                                                                                                       |      |      | ±30  | ppm   |
| $C_{\text{L\_HFXO}}$            | Load capacitance                                                                                                                                                                                                    | 6    | 8    | 12   | pF    |
| $C_{\text{0\_HFXO}}$            | Shunt capacitance                                                                                                                                                                                                   |      |      | 7    | pF    |
| $R_{\text{S\_HFXO\_7PF}}$       | Equivalent series resistance 3 pF < $C_0$ ≤ 7 pF                                                                                                                                                                    |      |      | 60   | Ω     |
| $R_{\text{S\_HFXO\_3PF}}$       | Equivalent series resistance $C_0$ ≤ 3 pF                                                                                                                                                                           |      |      | 100  | Ω     |
| $P_{\text{D\_HFXO}}$            | Drive level                                                                                                                                                                                                         |      |      | 100  | μW    |
| $C_{\text{PIN\_HFXO}}$          | Input capacitance XC1 and XC2 with internal capacitors disabled                                                                                                                                                     |      | 5.5  |      | pF    |
| $C_{\text{PIN\_HFXO\_INT}}$     | Input capacitance XC1 and XC2 with internal capacitors enabled                                                                                                                                                      |      | 2.5  |      | pF    |
| $C_{\text{HFXO\_INT\_MIN}}$     | Input capacitance XC1 and XC2, internal capacitor at minimum value, excluding $C_{\text{PIN\_HFXO\_INT}}$                                                                                                           |      | 7    |      | pF    |
| $C_{\text{HFXO\_INT\_MAX}}$     | Input capacitance XC1 and XC2, internal capacitor at maximum value, excluding $C_{\text{PIN\_HFXO\_INT}}$                                                                                                           |      | 20   |      | pF    |
| $I_{\text{STBY\_X32M}}$         | Core standby current for various crystals                                                                                                                                                                           |      |      |      |       |
| $I_{\text{STBY\_X32M\_X0}}$     | Typical parameters for a given 2.5mm x 2.0mm crystal:<br><br>$CL_{\text{HFXO}} = 8 \text{ pF}$ , $CO_{\text{HFXO}} = 1 \text{ pF}$ , $LM_{\text{HFXO}} = 7 \text{ mH}$ , $RS_{\text{HFXO}} = 20 \text{ Ω}$          |      | 65   |      | μA    |
| $I_{\text{STBY\_X32M\_X1}}$     | Typical parameters for a given 1.6mm x 1.2mm crystal:<br><br>$CL_{\text{HFXO}} = 8 \text{ pF}$ , $CO_{\text{HFXO}} = 0.4 \text{ pF}$ , $LM_{\text{HFXO}} = 20 \text{ mH}$ , $RS_{\text{HFXO}} = 40 \text{ Ω}$       |      | 187  |      | μA    |
| $I_{\text{STBY\_X32M\_X2}}$     | Typical parameters for a given 2.0mm x 1.6mm crystal:<br><br>$CL_{\text{HFXO}} = 8 \text{ pF}$ , $CO_{\text{HFXO}} = 0.73 \text{ pF}$ , $LM_{\text{HFXO}} = 9.47 \text{ mH}$ , $RS_{\text{HFXO}} = 16.32 \text{ Ω}$ |      | 135  |      | μA    |
| $I_{\text{STBY\_X32M\_X3}}$     | Typical parameters for a given 1.2mm x 1.0mm crystal:<br><br>$CL_{\text{HFXO}} = 8 \text{ pF}$ , $CO_{\text{HFXO}} = 0.42 \text{ pF}$ , $LM_{\text{HFXO}} = 22.7 \text{ mH}$ , $RS_{\text{HFXO}} = 100 \text{ Ω}$   |      | 181  |      | μA    |
| $I_{\text{START\_X32M}}$        | Average startup current for various crystals, first 1 ms                                                                                                                                                            |      |      |      |       |
| $I_{\text{START\_X32M\_X0}}$    | Typical parameters for a given 2.5mm x 2.0mm crystal:<br><br>$CL_{\text{HFXO}} = 8 \text{ pF}$ , $CO_{\text{HFXO}} = 1 \text{ pF}$ , $LM_{\text{HFXO}} = 7 \text{ mH}$ , $RS_{\text{HFXO}} = 20 \text{ Ω}$          |      | 363  |      | μA    |

| Symbol                  | Description                                                                                                                                 | Min. | Typ. | Max. | Units   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------|
| $I_{START\_X32M\_X1}$   | Typical parameters for a given 1.6mm x 1.2mm crystal:<br><br>CL_HFXO = 8 pF, CO_HFXO = 0.4 pF, LM_HFXO = 20 mH, RS_HFXO = 40 $\Omega$       |      | 790  |      | $\mu$ A |
| $I_{START\_X32M\_X2}$   | Typical parameters for a given 2.0mm x 1.6mm crystal:<br><br>CL_HFXO = 8 pF, CO_HFXO = 0.73 pF, LM_HFXO = 9.47 mH, RS_HFXO = 16.32 $\Omega$ |      | 467  |      | $\mu$ A |
| $I_{START\_X32M\_X3}$   | Typical parameters for a given 1.2mm x 1.0mm crystal:<br><br>CL_HFXO = 8 pF, CO_HFXO = 0.42 pF, LM_HFXO = 22.7 mH, RS_HFXO = 100 $\Omega$   |      | 863  |      | $\mu$ A |
| $t_{POWERUP\_X32M}$     | Power-up time for various crystals                                                                                                          |      |      |      |         |
| $t_{POWERUP\_X32M\_X0}$ | Typical parameters for a given 2.5mm x 2.0mm crystal:<br><br>CL_HFXO = 8 pF, CO_HFXO = 1 pF, LM_HFXO = 7 mH, RS_HFXO = 20 $\Omega$          |      | 60   |      | $\mu$ s |
| $t_{POWERUP\_X32M\_X1}$ | Typical parameters for a given 1.6mm x 1.2mm crystal:<br><br>CL_HFXO = 8 pF, CO_HFXO = 0.4 pF, LM_HFXO = 20 mH, RS_HFXO = 40 $\Omega$       |      | 187  |      | $\mu$ s |
| $t_{POWERUP\_X32M\_X2}$ | Typical parameters for a given 2.0mm x 1.6mm crystal:<br><br>CL_HFXO = 8 pF, CO_HFXO = 0.73 pF, LM_HFXO = 9.47 mH, RS_HFXO = 16.32 $\Omega$ |      | 60   |      | $\mu$ s |
| $t_{POWERUP\_X32M\_X3}$ | Typical parameters for a given 1.2mm x 1.0mm crystal:<br><br>CL_HFXO = 8 pF, CO_HFXO = 0.42 pF, LM_HFXO = 22.7 mH, RS_HFXO = 100 $\Omega$   |      | 211  |      | $\mu$ s |

#### 4.12.5.2 32.768 kHz crystal oscillator (LFXO)

| Symbol                 | Description                                                                                            | Min. | Typ.   | Max.      | Units      |
|------------------------|--------------------------------------------------------------------------------------------------------|------|--------|-----------|------------|
| $f_{LFXO}$             | External crystal frequency                                                                             |      | 32.768 |           | kHz        |
| $f_{TOL\_LFXO\_BLE}$   | Frequency tolerance requirement, Bluetooth Low Energy applications                                     |      |        | $\pm 500$ | ppm        |
| $f_{TOL\_LFXO\_ANT}$   | Frequency tolerance requirement for ANT applications                                                   |      |        | $\pm 50$  | ppm        |
| $C_{L\_LFXO}$          | Load capacitance                                                                                       |      | 7      | 9         | pF         |
| $C_{0\_LFXO}$          | Shunt capacitance                                                                                      |      | 1      | 2         | pF         |
| $R_{S\_LFXO}$          | Equivalent series resistance                                                                           |      | 60     | 90        | k $\Omega$ |
| $P_{D\_LFXO}$          | Drive level                                                                                            |      |        | 0.5       | $\mu$ W    |
| $C_{pin}$              | Input capacitance on XL1 and XL2 pads when internal capacitor is disabled                              |      | 4      |           | pF         |
| $C_{pin}$              | Total capacitance between XL1 and XL2 pads when internal capacitor enabled                             | 6    | 7      | 9         | pF         |
| $V_{AMP\_IN\_XO\_LOW}$ | Peak-to-peak amplitude for external low swing clock. Input signal must not swing outside supply rails. | 200  |        | 1000      | mV         |

# 5 Application core

The application core contains a low-power microcontroller with embedded flash memory and a full featured Arm Cortex-M33 processor.

In addition, the application core includes a rich set of peripherals for serial communication, analog interfaces, and cryptographic acceleration. See the following figure for more information. Arrows with white heads indicate signals that share physical pins with other signals, while arrows with black heads are dedicated to one signal.

## 5.1 Block diagram

The following image shows the application core block diagram.

Figure 26: Application core block diagram

## 5.2 CPU

The Arm Cortex-M33 processor has a 32-bit instruction set (Thumb-2 technology) that implements a super set of 16- and 32-bit instructions to maximize code density and performance.

This processor implements several features that enable energy-efficient arithmetic and high-performance signal processing including:

- Digital signal processing (DSP) instructions
- Single-cycle multiply and accumulate (MAC) instructions
- Hardware divide
- 8- and 16-bit single instruction multiple data (SIMD) instructions
- Single-precision floating-point unit (FPU)
- Memory Protection Unit (MPU)
- Arm TrustZone for Armv8-M

The [Arm Cortex Microcontroller Software Interface Standard \(CMSIS\)](#) is implemented and available for the application processor.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the Nested Vectored Interrupt Controller (NVIC).

Executing code from internal or external flash will have a wait state penalty. The instruction cache can be enabled to minimize flash wait states when fetching instructions. For more information on cache, see [CACHE — Instruction/data cache](#) on page 112. CPU performance parameters including wait states for different configurations, CPU current consumption and efficiency, and processing power and efficiency based on the CoreMark benchmark can be found in [Electrical specification](#) on page 106.

### 5.2.1 Floating point interrupt

The floating point unit (FPU) may generate exceptions, for example, due to overflow or underflow. These exceptions may trigger interrupts when enabled in the FPU peripheral. For more information, see [FPU — Floating point unit \(FPU\) exceptions](#) on page 288.

### 5.2.2 Electrical specification

#### 5.2.2.1 CPU performance

| Symbol                      | Description                                                             | Min. | Typ. | Max. | Units            |
|-----------------------------|-------------------------------------------------------------------------|------|------|------|------------------|
| W <sub>FLASH128</sub>       | CPU wait states, running CoreMark at 128 MHz from flash, cache disabled |      |      | 4    |                  |
| W <sub>FLASHCACHE128</sub>  | CPU wait states, running CoreMark at 128 MHz from flash, cache enabled  |      |      | 5    |                  |
| W <sub>RAM128</sub>         | CPU wait states, running CoreMark at 128 MHz from RAM                   |      | 0    |      |                  |
| W <sub>FLASH64</sub>        | CPU wait states, running CoreMark at 64 MHz from flash, cache disabled  |      |      | 5    |                  |
| W <sub>FLASHCACHE64</sub>   | CPU wait states, running CoreMark at 64 MHz from flash, cache enabled   |      |      | 6    |                  |
| W <sub>RAM64</sub>          | CPU wait states, running CoreMark at 64 MHz from RAM                    |      | 0    |      |                  |
| CM <sub>FLASHCACHE128</sub> | CoreMark, running from flash, cache enabled, HFXO128M                   |      | 514  |      | CoreMark         |
| CM <sub>FLASH128/MHz</sub>  | CoreMark per MHz, running from flash, cache enabled, HFXO128M           |      | 4.0  |      | CoreMark/<br>MHz |

### 5.2.3 CPU and support module configuration

The Arm Cortex-M33 processor has a number of CPU options and support modules implemented on the device.

| Option/Module             | Description                         | Implemented                                                             |
|---------------------------|-------------------------------------|-------------------------------------------------------------------------|
| Core options              |                                     |                                                                         |
| PRIORITIES                | Priority bits                       | 3                                                                       |
| WIC                       | Wakeup Interrupt Controller         | NO                                                                      |
| Endianness                | Memory system endianness            | Little endian                                                           |
| DWT                       | Data Watchpoint and Trace           | YES                                                                     |
| Modules                   |                                     |                                                                         |
| MPU                       | Number of non-secure MPU regions    | 8                                                                       |
|                           | Number of secure MPU regions        | 8                                                                       |
| SAU                       | Number of SAU regions               | 0<br>See <a href="#">SPU</a> for more information about secure regions. |
| FPU                       | Floating-point unit                 | YES                                                                     |

| HTM                       | AHB Trace Macrocell                 | NO                                                                      |

## 5.3 Memory

The application core contains flash memory and RAM that can be used for code and data storage.

The following figure shows how the CPU, network core, and peripherals with EasyDMA can access RAM via the AHB multilayer interconnect. The domain configuration (DCNF) registers can block access from external DMA masters, see [DCNF — Domain configuration](#) on page 269.

Figure 27: Memory layout

### 5.3.1 Peripheral instantiation

The following table describes the abbreviations used in the Instance, Secure mapping, and DMA security columns of the instantiation table.

| Abbreviation | Description                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NS           | Trustzone/security attribute is Non-secure - The peripheral is accessible as a Non-secure peripheral.                                                                   |
| S            | Trustzone/security attribute is Secure - The peripheral is accessible as a Secure peripheral.                                                                           |
| US           | Trustzone Map is user selectable - The Trustzone/security attribute of the peripheral can be configured using <a href="#">SPU — System protection unit</a> on page 651. |
| HF           | Trustzone Map is hardware fixed - The Trustzone/security attribute of the peripheral cannot be changed.                                                                 |
| NA           | Not Applicable - Peripheral has no DMA capability.                                                                                                                      |
| NSA          | NoSeparateAttribute - Peripheral with DMA and DMA transfer has the same security attribute as assigned to the peripheral.                                               |
| SA           | SeparateAttribute - Peripheral with DMA and DMA transfers can have a different security attribute than the one assigned to the peripheral.                              |

Table 16: Instantiation table abbreviations

The Secure mapping column in the following table defines configuration capabilities for the Arm TrustZone for Armv8-M secure attribute. The DMA security column describes the DMA capabilities of the peripheral.

### 5.3.1.1 Instantiation

| ID | Base address | Instance         | TrustZone |     |     | Split access | Description                           |
|----|--------------|------------------|-----------|-----|-----|--------------|---------------------------------------|
|    |              |                  | Map       | Att | DMA |              |                                       |
| 0  | 0x50000000   | DCNF : S         | US        | S   | NA  | No           | Domain configuration                  |

Table 17: Instantiation table

## 5.4 Core components

### 5.4.1 CACHE — Instruction/data cache

The cache is two-way set associative with a least recently used (LRU) replacement policy. Both instruction and data accesses towards flash memory or XIP code regions are cached.

The cache has the following features:

- 128-bit cache line
- Configurable as a cache or general purpose RAM
- Hit/miss counters per NVM region and access type (instruction or data)
- Readable cache content (for profiling)
  - Data, tag, valid, and most recently used (MRU) bits
  - Can be disabled when not in use
- Manual invalidation and erase support
- Locking cache updates on cache misses

Figure 28: Cache overview

In Cache mode (**MODE**=Cache), instruction and data accesses from the CPU over the code bus towards internal or external flash, are cached. The contents of the cache, i.e. data, tag, valid, and MRU bits, are memory mapped, see [Cache content](#) on page 113. This can be used for performance profiling of code running in the system. Access to the cache content region is read-only by default, but can be blocked by enabling a lock bit in **DEBUGLOCK** on page 118. Preventing cache content updates on cache misses can be enabled through register **DEBUGLOCK** on page 118. When enabled, cache content is not replaced, but kept intact. The cache is still enabled and provides fast instruction and data fetches for cached content.

Access to internal or external flash memory will not be cached when in Ram mode (**MODE**=Ram). Instead, the cache data content, as described in [Cache content](#) on page 113, can be used as read/write RAM.

#### 5.4.1.1 Cache content

Cache information is divided into cache info content and cache data content.

Cache info content is organized in memory as shown in the following figure.

Figure 29: Cache info content

The V field contains the bit that indicates if a cache entry is valid or not. All V fields are cleared when invalidating the cache using register [INVALIDATE](#) on page 117, when disabling the cache using register [ENABLE](#) on page 116, or when changing [MODE](#) from Ram to Cache. The MRU field indicates which way was used most recently in the set. The MRU bit is updated on each fetch from the cache and is used for the cache replacement policy. The Tag field is used to check if an entry in the cache matches the address being fetched.

The following figure shows how the cache data content is organized in memory.

Figure 30: Cache data content

Each set consists of two ways, each containing 128 bits of data. The 128-bit data is available as 4x32-bit words in sequential order. When operating in Ram mode ([MODE](#) = Ram), the data is accessible as general purpose RAM.

The cache info and cache data content are memory mapped in the [CACHEINFO](#) and [CACHEDATA](#) regions. These can be accessed in the [CACHEINFO registers](#) and [CACHEDATA registers](#) respectively.

### 5.4.1.2 Profiling

The cache includes profiling counters **IHIT**, **IMISS**, **DHIT**, and **DMISS** for both flash and execute-in-place (XIP).

Cache performance on executed code is indicated by these counters when enabled through **PROFILINGENABLE** on page 117. The counters can be cleared at any time using **PROFILINGCLEAR** on page 117. Writing to this register will clear all profiling counters. After being cleared, the counters will increment at the next instruction, or data fetch, according to the rules in the following table.

| Profiling counter | Description                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------|
| <b>IHIT</b>       | Increased on a cache hit for instruction fetch                                                   |
| <b>IMISS</b>      | Increased on a cache miss for instruction fetch                                                  |
| <b>DHIT</b>       | Increased on a cache hit for data fetch (i.e. LOAD type instruction targeting the cache region)  |
| <b>DMISS</b>      | Increased on a cache miss for data fetch (i.e. LOAD type instruction targeting the cache region) |

Table 18: Profiling counters

### 5.4.1.3 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description |
|----------|-------------|--------------|-----------|-----|-----|--------------|-------------|
|          |             |              | Map       | Att | DMA |              |             |
| CACHE    | APPLICATION | 0x50001000   | HF        | S   | NA  | No           | Cache       |

#### Register overview

| Register                  | Offset | TZ | Description                                                                                                                                                                                       |
|---------------------------|--------|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PROFILING[n].IHIT</b>  | 0x400  |    | Instruction fetch cache hit counter for cache region n, where n=0 means Flash and n=1 means XIP.                                                                                                  |
| <b>PROFILING[n].IMISS</b> | 0x404  |    | Instruction fetch cache miss counter for cache region n, where n=0 means Flash and n=1 means XIP.                                                                                                 |
| <b>PROFILING[n].DHIT</b>  | 0x408  |    | Data fetch cache hit counter for cache region n, where n=0 means Flash and n=1 means XIP.                                                                                                         |
| <b>PROFILING[n].DMISS</b> | 0x40C  |    | Data fetch cache miss counter for cache region n, where n=0 means Flash and n=1 means XIP.                                                                                                        |
| <b>ENABLE</b>             | 0x500  |    | Enable cache.                                                                                                                                                                                     |
| <b>INVALIDATE</b>         | 0x504  |    | Invalidate the cache.                                                                                                                                                                             |
| <b>ERASE</b>              | 0x508  |    | Erase the cache.                                                                                                                                                                                  |
| <b>PROFILINGENABLE</b>    | 0x50C  |    | Enable the profiling counters.                                                                                                                                                                    |
| <b>PROFILINGCLEAR</b>     | 0x510  |    | Clear the profiling counters.                                                                                                                                                                     |

#### 5.4.1.3.9 PROFILINGCLEAR

Address offset: 0x510

Clear the profiling counters.

The profiling counters can be cleared at any time. When cleared, all profiling counters will be set to zero, and will increment at the next instruction or data fetch.

#### 5.4.1.3.10 MODE

Address offset: 0x514

Cache mode.

Switching from Cache to Ram mode causes the RAM to be cleared.

Switching from RAM to Cache mode causes the cache to be invalidated.

#### 5.4.1.3.11 DEBUGLOCK

Address offset: 0x518

Lock debug mode.

This register is ignored when CACHE is used in RAM mode. Once this register has been set to Locked, the debug mode can only be unlocked by resetting the device.

### 5.4.1.3.13 WRITELOCK

Address offset: 0x520

Lock cache updates. Prevents updating of cache content on cache misses, but will continue to lookup instruction/data fetches in content already present in the cache.

Ignored in RAM mode.

 ### 5.4.2 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory and cannot be erased by the user. These registers contain chip-specific information and configuration.

**Note:** FICR is not accessible from the network core.

#### 5.4.2.1 Registers

##### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description                                 |
|----------|-------------|--------------|-----------|-----|-----|--------------|---------------------------------------------|
|          |             |              | Map       | Att | DMA |              |                                             |
| FICR     | APPLICATION | 0x00FF0000   | HF        | S   | NA  | No           | Factory information configuration registers |

##### Register overview

| Register          | Offset | TZ | Description                                                 |
|-------------------|--------|----|-------------------------------------------------------------|
| INFO.CONFIGID     | 0x200  |    | Configuration identifier                                    |
| INFO.DEVICEID[n]  | 0x204  |    | Device identifier                                           |
| INFO.PART         | 0x20C  |    | Part code                                                   |
| INFO.VARIANT      | 0x210  |    | Part Variant, Hardware version and Production configuration |
| INFO.PACKAGE      | 0x214  |    | Package option                                              |
| INFO.RAM          | 0x218  |    | RAM variant                                                 |
| INFO.FLASH        | 0x21C  |    | Flash variant                                               |
| INFO.CODEPAGESIZE | 0x220  |    | Code memory page size in bytes                              |
| INFO.CODESIZE     | 0x224  |    | Code memory size                                            |
| INFO.DEVICETYPE   | 0x228  |    | Device type                                                 |

| Register         | Offset | TZ | Description                                                                                                              |
|------------------|--------|----|--------------------------------------------------------------------------------------------------------------------------|
| TRIMCNF[n].ADDR  | 0x300  |    | Address of the PAR register which will be written                                                                        |
| TRIMCNF[n].DATA  | 0x304  |    | Data                                                                                                                     |
| NFC.TAGHEADER0   | 0x450  |    | Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST. |
| NFC.TAGHEADER1   | 0x454  |    | Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST. |
| NFC.TAGHEADER2   | 0x458  |    | Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST. |
| NFC.TAGHEADER3   | 0x45C  |    | Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST. |
| TRNG90B.BYTES    | 0xC00  |    | Amount of bytes for the required entropy bits                                                                            |
| TRNG90B.RCCUTOFF | 0xC04  |    | Repetition counter cutoff                                                                                                |
| TRNG90B.APCUTOFF | 0xC08  |    | Adaptive proportion cutoff                                                                                               |
| TRNG90B.STARTUP  | 0xC0C  |    | Amount of bytes for the startup tests                                                                                    |
| TRNG90B.ROSC1    | 0xC10  |    | Sample count for ring oscillator 1                                                                                       |
| TRNG90B.ROSC2    | 0xC14  |    | Sample count for ring oscillator 2                                                                                       |
| TRNG90B.ROSC3    | 0xC18  |    | Sample count for ring oscillator 3                                                                                       |
| TRNG90B.ROSC4    | 0xC1C  |    | Sample count for ring oscillator 4                                                                                       |
| XOSC32MTRIM      | 0xC20  |    | XOSC32M capacitor selection trim values                                                                                  |

### 5.4.3 UICR — User information configuration registers

The user information configuration registers (UICRs) are non-volatile memory (NVM) registers for configuring user specific settings and storing secure cryptographic keys or OTP values.

The cryptographic key part of the UICR (addresses starting at 0x100 and higher) is handled by the Key Management Unit (KMU), see [KMU — Key management unit](#) on page 343 for more information.

For information on writing registers, see [NVMC — Non-volatile memory controller](#) on page 400 and [Memory](#) on page 21.

Any access, both read and write, to UICR must be a full 32-bit word aligned to a 32-bit address.

**Note:** UICR is not accessible from the network core.

#### 5.4.3.1 Registers

##### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split<br>access | Description                              |

| OTP[n]                  | 0x100  |    | One time programmable memory                                                                                                                                                                                                                                                                              |
| KEYSLOT.CONFIG[n].DEST  | 0x400  |    | Destination address where content of the key value registers (KEYSLOT.KEYn.VALUE[0-3]) will be pushed by KMU. Note that this address must match that of a peripherals APB mapped write-only key registers, else the KMU can push this key value into an address range which the CPU can potentially read. |
| KEYSLOT.CONFIG[n].PERM  | 0x404  |    | Define permissions for the key slot. Bits 0-15 and 16-31 can only be written when equal to 0xFFFF.                                                                                                                                                                                                        |
| KEYSLOT.KEY[n].VALUE[o] | 0x800  |    | Define bits [31+o*32:0+o*32] of value assigned to KMU key slot.                                                                                                                                                                                                                                           |

### 5.4.3.1.2 VREGHVOUT

Address offset: 0x010

Output voltage from the high voltage (VREGH) regulator stage. The maximum output voltage from this stage is given as VDDH - VREGHDROP.

|                  |     |           |          |                                                                                       |  |  |  |                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 5.4.3.1.3 HFXOCNT

Address offset: 0x014

HFXO startup counter

The CLKSTARTED events are generated after the HFXO power up time + the HFXOCNT-defined debounce time + PLL lock time has elapsed. If the HFXO has already been requested by another clock source and is already running, the CLKSTARTED event is generated as soon as the PLL has locked.

**Note:** When HFXOCNT field of this register is 0xFF, e.g. after UICR being erased, a debounce time of (4\*64 us + 0.5 us) is used

### 5.4.3.1.7 NFCPINS

Address offset: 0x028

Setting of pins dedicated to NFC functionality: NFC antenna or GPIO

**Note:** When used as NFC antenna pin, the corresponding pin must be controlled by the application core, and the GPIO PIN\_CNF register initialized to its reset value.

#### 5.4.3.1.9 KEYSLOT.CONFIG[n].DEST (n=0..127)

Address offset:  $0x400 + (n \times 0x8)$

Destination address where content of the key value registers (KEYSLOT.KEYn.VALUE[0-3]) will be pushed by KMU. Note that this address must match that of a peripherals APB mapped write-only key registers, else the KMU can push this key value into an address range which the CPU can potentially read.

**Note:** Writing/reading this register requires the KMU SELECTKEYSLOT register to be set to n+1.

### 5.4.4 AHB multilayer

AHB multilayer enables parallel access paths between multiple masters and slaves in a system. Access is resolved using priorities.

Each bus master is connected to a slave device through one or more interconnection matrixes. The bus masters are assigned priorities that are used to resolve access when two (or more) bus masters request access to the same slave device. The following applies when assigning priorities:

- If two (or more) bus masters request access to the same slave device, the master with the highest priority is granted access first.
- If a higher priority bus master transaction is on-going, bus masters with lower priority are stalled. Either until the higher priority master has completed its transaction, or the higher priority master at any point pauses during its transaction. During this pause, the lower priority master in queue is temporarily granted access to the slave device until the higher priority master resumes its activity.
- If a lower priority bus master transaction is on-going, and a master with higher priority requests access to the same slave device, the lower priority bus master is stalled after the current word access has been completed. The slave transaction will continue following the rules above.
- Bus masters that have the same priority are mutually exclusive, and cannot be used concurrently.

Some peripherals, like I2S, do not have a safe stalling mechanism (not able to pause incoming data and no internal data buffering). Being a low priority bus master might cause loss of data for such peripherals upon bus contention. To avoid AHB bus contention when using multiple bus masters, apply one of the following guidelines:

- Avoid situations where more than one bus master is accessing the same slave.
- If more than one bus master is accessing the same slave, make sure that the bus bandwidth is not exhausted.

#### 5.4.4.1 AHB multilayer priorities

Each master connected to the AHB multilayer is assigned a default natural priority.

| Bus master name                    | Natural relative priority | In/Out |
|------------------------------------|---------------------------|--------|
| CPU                                | Highest priority          | I/O    |
| Network core                       |                           | I/O    |
| I2S                                |                           | I/O    |
| PDM                                |                           | I      |
| UARTE0, SPIM0, SPIS0, TWIM0, TWIS0 |                           | I/O    |
| UARTE1, SPIM1, SPIS1, TWIM1, TWIS1 |                           | I/O    |

Table 19: AHB bus masters

# 6 Network core

The network core contains a low-power microcontroller with embedded flash memory and an Arm Cortex-M33 processor.

The network core includes peripherals for efficient implementation of radio protocols such as Bluetooth Low Energy, 802.15.4, and proprietary 2.4 GHz. The following figure provides more information. Arrows with white heads indicate signals that share physical pins with other signals.

## 6.1 Block diagram

The following image shows the network core block diagram.

The Arm Cortex-M33 processor has a 32-bit instruction set (Thumb-2 technology) that implements a super set of 16- and 32-bit instructions to maximize code density and performance.

This processor implements several features that enable energy-efficient arithmetic and high-performance signal processing including:

- Hardware divide
- 8- and 16-bit single instruction multiple data (SIMD) instructions
- Memory Protection Unit (MPU)

The [Arm Cortex Microcontroller Software Interface Standard \(CMSIS\)](#) is implemented and available for the application processor.

Real-time execution is highly deterministic in thread mode, to and from sleep modes, and when handling events at configurable priority levels via the Nested Vectored Interrupt Controller (NVIC).

Executing code from internal or external flash will have a wait state penalty. The instruction cache can be enabled to minimize flash wait states when fetching instructions. For more information on cache, see [NVMC — Non-volatile memory controller](#) on page 400. CPU performance parameters including mode wait states, CPU current and efficiency, and processing power and efficiency based on the CoreMark benchmark can be found in [Electrical specification](#) on page 137.

## 6.2.1 Electrical specification

### 6.2.1.1 CPU performance

| Symbol                   | Description                                         | Min. | Typ. | Max. | Units            |

| CM <sub>FLASHCACHE</sub> | CoreMark, running from flash, cache enabled         |      | 244  |      | CoreMark         |
| CM <sub>FLASH/MHz</sub>  | CoreMark per MHz, running from flash, cache enabled |      | 3.8  |      | CoreMark/<br>MHz |
| CM <sub>FLASH/mA</sub>   | CoreMark per mA, running from flash, cache enabled  |      | 101  |      | CoreMark/mA      |

### 6.2.2 CPU and support module configuration

The Arm Cortex-M33 processor has a number of CPU options and support modules implemented on the device.

| Option/Module     | Description                                   | Implemented                                          |
|-------------------|-----------------------------------------------|------------------------------------------------------|
| Core options      |                                               |                                                      |
| PRIORITIES        | Priority bits                                 | 3                                                    |
| WIC               | Wakeup Interrupt Controller                   | NO                                                   |
| Endianness        | Memory system endianness                      | Little endian                                        |
| DWT               | Data Watchpoint and Trace                     | YES                                                  |
| Modules           |                                               |                                                      |
| MPU               | Number of non-secure MPU regions              | 8                                                    |
|                   | Number of secure MPU regions                  | 0 (No Armv8-M Security Extensions)                   |
| SAU               | Number of SAU regions                         | 0 (No Arm TrustZone for Armv8-M Security Extensions) |
| FPU               | Floating-point unit                           | NO                                                   |
| DSP               | Digital Signal Processing Extension           | NO                                                   |
| Armv8-M TrustZone | Arm TrustZone for Armv8-M Security Extensions | NO                                                   |
| CPIF              | Coprocessor interface                         | NO                                                   |
| ETM               | Embedded Trace Macrocell                      | NO                                                   |
| ITM               | Instrumentation Trace Macrocell               | NO                                                   |
| MTB               | Micro Trace Buffer                            | NO                                                   |
| CTI               | Cross Trigger Interface                       | YES                                                  |
| BPU               | Breakpoint Unit                               | YES                                                  |
| HTM               | AHB Trace Macrocell                           | NO                                                   |

## 6.3 Memory

The network core contains flash memory and RAM that can be used for code and data storage.

The following figure shows how the CPU and peripherals with EasyDMA can access RAM via the AHB multilayer interconnect.

The network core can access application core resources (flash, RAM, and peripherals) when granted permission through the application's DCNF and SPU settings. A small portion of the application core RAM is dedicated to the exchange of messages between the application and network cores.

Figure 32: Memory layout

### 6.3.1 Peripheral instantiation

The following table describes the abbreviations used in the Instance, Secure mapping, and DMA security columns of the instantiation table.

| Abbreviation | Description                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NS           | Trustzone/security attribute is Non-secure - The peripheral is accessible as a Non-secure peripheral.                                                                   |
| S            | Trustzone/security attribute is Secure - The peripheral is accessible as a Secure peripheral.                                                                           |
| US           | Trustzone Map is user selectable - The Trustzone/security attribute of the peripheral can be configured using <a href="#">SPU — System protection unit</a> on page 651. |
| HF           | Trustzone Map is hardware fixed - The Trustzone/security attribute of the peripheral cannot be changed.                                                                 |
| NA           | Not Applicable - Peripheral has no DMA capability.                                                                                                                      |
| NSA          | NoSeparateAttribute - Peripheral with DMA and DMA transfer has the same security attribute as assigned to the peripheral.                                               |
| SA           | SeparateAttribute - Peripheral with DMA and DMA transfers can have a different security attribute than the one assigned to the peripheral.                              |

Table 20: Instantiation table abbreviations

The Secure mapping column in the following table defines configuration capabilities for the Arm TrustZone for Armv8-M secure attribute. The DMA security column describes the DMA capabilities of the peripheral.

### 6.3.2 Instantiation

| ID | Base address | Instance                 | TrustZone |     |     | Split access | Description                                          |
|----|--------------|--------------------------|-----------|-----|-----|--------------|------------------------------------------------------|
|    |              |                          | Map       | Att | DMA |              |                                                      |
| 0  | 0x41000000   | <a href="#">DCNF</a>     | HF        | NS  | NA  | No           | Domain configuration                                 |

Table 21: Instantiation table

## 6.4 Core components

### 6.4.1 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory and cannot be erased by the user. These registers contain chip-specific information and configuration.

#### 6.4.1.1 Registers

##### Instances

| Instance | Domain  | Base address | TrustZone |     |     | Split access | Description                       |
|----------|---------|--------------|-----------|-----|-----|--------------|-----------------------------------|
|          |         |              | Map       | Att | DMA |              |                                   |
| FICR     | NETWORK | 0x01FF0000   | HF        | NS  | NA  | No           | Factory information configuration |

##### Register overview

| Register          | Offset | TZ | Description                                                 |
|-------------------|--------|----|-------------------------------------------------------------|
| INFO.CONFIGID     | 0x200  |    | Configuration identifier                                    |
| INFO.DEVICEID[n]  | 0x204  |    | Device identifier                                           |
| INFO.PART         | 0x20C  |    | Part code                                                   |
| INFO.VARIANT      | 0x210  |    | Part Variant, Hardware version and Production configuration |
| INFO.PACKAGE      | 0x214  |    | Package option                                              |
| INFO.RAM          | 0x218  |    | RAM variant                                                 |
| INFO.FLASH        | 0x21C  |    | Flash variant                                               |
| INFO.CODEPAGESIZE | 0x220  |    | Code memory page size in bytes                              |
| INFO.CODESIZE     | 0x224  |    | Code memory size                                            |
| INFO.DEVICETYPE   | 0x228  |    | Device type                                                 |

 ### 6.4.2 UICR — User information configuration registers

The user information configuration registers (UICRs) are non-volatile memory (NVM) registers for configuring user specific settings.

For information on writing registers, see [NVMC — Non-volatile memory controller](#) on page 400 and [Memory](#) on page 138.

Any access, both read and write, to UICR must be a full 32-bit word aligned to a 32-bit address.

#### 6.4.2.1 Registers

##### Instances

| Instance | Domain  | Base address | TrustZone |     |     | Split access | Description                    |
|----------|---------|--------------|-----------|-----|-----|--------------|--------------------------------|
|          |         |              | Map       | Att | DMA |              |                                |
| UICR     | NETWORK | 0x01FF8000   | HF        | NS  | NA  | No           | User information configuration |

##### Register overview

| Register     | Offset | TZ | Description                         |
|--------------|--------|----|-------------------------------------|
| APPROTECT    | 0x000  |    | Access port protection              |
| ERASEPROTECT | 0x004  |    | Erase protection                    |
| NRFFW[n]     | 0x200  |    | Reserved for Nordic firmware design |
| CUSTOMER[n]  | 0x300  |    | Reserved for customer               |

#### 6.4.2.1.1 APPROTECT

Address offset: 0x000

Access port protection

|            |  |  |  |   ### 6.4.3 AHB multilayer

AHB multilayer enables parallel access paths between multiple masters and slaves in a system. Access is resolved using priorities.

Each bus master is connected to a slave device through one or more interconnection matrixes. The bus masters are assigned priorities that are used to resolve access when two (or more) bus masters request access to the same slave device. The following applies when assigning priorities:

- If two (or more) bus masters request access to the same slave device, the master with the highest priority is granted access first.
- Bus masters with lower priority are stalled until the higher priority master has completed its transaction.
- If the higher priority master pauses at any point during its transaction, the lower priority master in queue is temporarily granted access to the slave device until the higher priority master resumes its activity.
- Bus masters that have the same priority are mutually exclusive, and cannot be used concurrently.

Some peripherals, like RADIO, do not have a safe stalling mechanism (not able to pause incoming data and no internal data buffering). Being a low priority bus master might cause loss of data for such peripherals upon bus contention. To avoid AHB bus contention when using multiple bus masters, apply one of the following guidelines:

- Avoid situations where more than one bus master is accessing the same slave.
- If more than one bus master is accessing the same slave, make sure that the bus bandwidth is not exhausted.

#### 6.4.3.1 AHB multilayer priorities

Each master connected to the AHB multilayer is assigned a default natural priority.

| Bus master name                | Natural relative priority | In/Out | Description                          |
|--------------------------------|---------------------------|--------|--------------------------------------|
| CPU                            | Highest priority          | I/O    |                                      |
| RADIO                          |                           | I/O    |                                      |
| CCM/ECB/AAR                    |                           | I/O    | Same priority and mutually exclusive |
| UARTE0/SPIM0/SPIS0/TWIM0/TWISO | Lowest priority           | I/O    | Same priority and mutually exclusive |

Table 22: AHB bus masters

# 7 Peripherals

nRF5340 is made up of two cores, each with their own peripherals.

The application core peripherals are found in [Instantiation](#) on page 109 and the network core peripherals are found in [Instantiation](#) on page 140. The application core peripherals are accessible from the network core, but the network core peripherals are not accessible from the application core. For further details, see [Memory](#) on page 21.

Some peripheral instances have differing configurations, such as some TIMER instances which have more capture and compare channels implemented than others. These differences are noted in the Configuration column of the peripheral's instantiation table.

## 7.1 Peripheral interface

Peripherals are controlled by the CPU through configuration registers, as well as task and event registers. Task registers are inputs, enabling the CPU and other peripherals to initiate a functionality. Event registers are outputs, enabling a peripheral to trigger tasks in other peripherals and/or the CPU by tying events to CPU interrupts.

Figure 33: Peripheral interface

The distributed programmable peripheral interconnect (DPPI) feature enables peripherals to connect events to tasks without CPU intervention. For more information on DPPI and the DPPI channels, see [DPPI — Distributed programmable peripheral interconnect](#) on page 272.

### 7.1.1 Peripheral ID

Every peripheral is assigned a fixed block of 0x1000 bytes of address space, which is equal to 1024 x 32 bit registers.

See [Peripherals](#) on page 149 for more information about which peripherals are available and where they are located in the address map.

There is a direct relationship between peripheral ID and base address. For example, a peripheral with base address 0x40000000 is assigned ID=0, a peripheral with base address 0x40001000 is assigned ID=1, and a peripheral with base address 0x4001F000 is assigned ID=31.

Peripherals may share the same ID, which may impose one or more of the following limitations:

- Shared registers or common resources
- Limited availability due to mutually exclusive operation; only one peripheral in use at a time
- Enforced peripheral behavior when switching between peripherals (disable the first peripheral before enabling the second)

## 7.1.2 Peripherals with shared ID

In general (with the exception of ID 0), peripherals sharing an ID and base address may not be used simultaneously. Only one peripheral can be enabled at a given ID.

When switching between two peripherals sharing an ID, the following should be performed to prevent unwanted behavior:

1. Disable the previously used peripheral.
2. Disable any publish/subscribe connection to the DPPI system for the peripheral that is being disabled.
3. Clear all bits in the INTEN register, i.e. `INTENCLR = 0xFFFFFFFF`.
4. Explicitly configure the peripheral being enabled. Do not rely on inherited configuration from the disabled peripheral.
5. Enable the now configured peripheral.

For a list of which peripherals that share an ID see [Peripherals](#) on page 149.

## 7.1.3 Peripheral registers

Most peripherals feature an ENABLE register. Unless otherwise specified, the peripheral registers must be configured before enabling the peripheral.

PSEL registers need to be set before a peripheral is enabled or started. Updating PSEL registers while the peripheral is running has no effect. To connect a peripheral to a different GPIO, the following must be performed:

1. Disable the peripheral.
2. Update the PSEL register.
3. Re-enable the peripheral.

It takes four CPU cycles between the PSEL register update and the connection between a peripheral and a GPIO becoming effective.

**Note:** The peripheral must be enabled before tasks and events can be used.

Most of the register values are lost during System OFF or when a reset is triggered. Some registers will retain their values in System OFF or for some specific reset sources. These registers are marked as retained in the register description for a given peripheral. For more information on their behavior, see chapter [RESET — Reset control](#) on page 65.

## 7.1.4 Bit set and clear

Registers with multiple single-bit bit fields may implement the set-and-clear pattern. This pattern enables firmware to set and clear individual bits in a register without having to perform a read-modify-write operation on the main register.

This pattern is implemented using three consecutive addresses in the register map, where the main register is followed by dedicated SET and CLR registers (in that exact order).

In the main register, the SET register sets individual bits and the CLR register clears them. Writing 1 to a bit in the SET or CLR register will set or clear the same bit in the main register respectively. Writing 0 to a bit in the SET or CLR register has no effect. Reading the SET or CLR register returns the value of the main register.

**Note:** The main register may not be visible and therefore not directly accessible in all cases.

### 7.1.5 Tasks

Tasks are used to trigger actions in a peripheral, such as to start a particular behavior. A peripheral can implement multiple tasks with each task having a separate register in that peripheral's task register group.

A task is triggered when firmware writes 1 to the task register, or when the peripheral itself or another peripheral toggles the corresponding task signal. See the figure [Peripheral interface](#) on page 150.

### 7.1.6 Events

Events are used to notify peripherals and the CPU about events that have happened, for example a state change in a peripheral. A peripheral may generate multiple events, where each event has a separate register in that peripheral's event register group.

An event is generated when the peripheral itself toggles the corresponding event signal, and the event register is updated to reflect that the event has been generated, see figure [Peripheral interface](#) on page 150. An event register is cleared when a 0 is written to it by firmware. Events can be generated by the peripheral even when the event register is set to 1.

### 7.1.7 Publish and subscribe

Events and tasks from different peripherals can be connected together through the DPPI system using the PUBLISH and SUBSCRIBE registers in each peripheral. See [Peripheral interface](#) on page 150. An event can be published onto a DPPI channel by configuring the event's PUBLISH register. Similarly, a task can subscribe to a DPPI channel by configuring the task's SUBSCRIBE register.

See [DPPI — Distributed programmable peripheral interconnect](#) on page 272 for details.

### 7.1.8 Shortcuts

A shortcut is a direct connection between an event and a task within the same peripheral. If a shortcut is enabled, the associated task is automatically triggered when its associated event is generated.

Using shortcuts is equivalent to making the connection outside the peripheral and through the DPPI. However, the propagation delay when using shortcuts is usually shorter than the propagation delay through the DPPI.

Shortcuts are predefined, which means that their connections cannot be configured by firmware. Each shortcut can be individually enabled or disabled through the shortcut register, one bit per shortcut, giving a maximum of 32 shortcuts for each peripheral.

### 7.1.9 Interrupts

All peripherals support interrupts which are generated by events.

A peripheral only occupies one interrupt, and the interrupt number follows the peripheral ID. For example, the peripheral with ID=4 is connected to interrupt number 4 in the nested vectored interrupt controller (NVIC).

Using registers INTEN, INTENSET, and INTENCLR, every event generated by a peripheral can be configured to generate that peripheral's interrupt. Multiple events can be enabled to generate interrupts simultaneously. To resolve the correct interrupt source, the event registers in the event group of peripheral registers will indicate the source.

Some peripherals implement only INTENSET and INTENCLR registers, and the INTEN register is not available on those peripherals. See the individual peripheral chapters for details. In all cases, reading back the INTENSET or INTENCLR register returns the same information as in INTEN.

Each event implemented in the peripheral is associated with a specific bit position in the INTEN, INTENSET, and INTENCLR registers.

The relationship between tasks, events, shortcuts, and interrupts is illustrated in figure [Peripheral interface](#) on page 150.

### 7.1.9.1 Interrupt clearing and disabling

Interrupts should always be cleared by writing 0 to the corresponding EVENT register.

Until cleared, interrupts will immediately be re-triggered and cause software interrupt service routines to be executed repeatedly.

Because the clearing of the EVENT register may take a number of CPU clock cycles, the program should perform a read from the EVENT register that has been cleared before exiting the interrupt service routine. This will ensure that the EVENT clearing has taken place before the interrupt service routine is exited. Care should be taken to ensure that the compiler does not remove the read operation as an optimization.

Similarly, when disabling an interrupt inside an interrupt service routine, the program should perform a read from the INTEN or INTENCLR registers to ensure that the interrupt is disabled before exiting the interrupt service routine.

### 7.1.10 Secure/non-secure peripherals

For some peripherals, the security configuration can change from secure to non-secure, or vice versa. Care must be taken when changing the security configuration of a peripheral, to prevent security information leakage and ensure correct operation.

The following sequence should be followed, where applicable, when configuring and changing the security settings of a peripheral in the [SPU — System protection unit](#) on page 651.

1. Stop peripheral operation.
2. Disable the peripheral.
3. Remove pin connections.
4. Disable DPPI connections.
5. Clear sensitive registers (e.g. writing back default values).
6. Change peripheral security setting in the [SPU — System protection unit](#) on page 651.
7. Re-enable the peripheral.

## 7.2 EasyDMA

EasyDMA is a module implemented by some peripherals to gain direct access to Data RAM.

EasyDMA is an AHB bus master similar to CPU and is connected to the AHB multilayer interconnect for direct access to Data RAM. EasyDMA cannot access flash memory.

A peripheral can implement multiple EasyDMA instances to provide dedicated channels. For example, for reading and writing of data between the peripheral and RAM. This concept is illustrated in the following figure.

Figure 34: EasyDMA example

An EasyDMA channel is implemented in the following way, but some variations may occur:

```

READERBUFFER_SIZE 5
WRITERBUFFER_SIZE 6

uint8_t readerBuffer[READERBUFFER_SIZE] __at__ 0x20000000;
uint8_t writerBuffer[WRITERBUFFER_SIZE] __at__ 0x20000005;

// Configuring the READER channel
MYPERIPHERAL->READER.MAXCNT = READERBUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &readerBuffer;

// Configure the WRITER channel
MYPERIPHERAL->WRITER.MAXCNT = WRITERBUFFER_SIZE;
MYPERIPHERAL->WRITER.PTR = &writerBuffer;

```

This example shows a peripheral called MYPERIPHERAL that implements two EasyDMA channels - one for reading called READER, and one for writing called WRITER. When the peripheral is started, it is assumed that the peripheral will perform the following tasks:

1. Read 5 bytes from the readerBuffer located in RAM at address 0x20000000.
2. Process the data.
3. Write no more than 6 bytes back to the writerBuffer located in RAM at address 0x20000005.

The memory layout of these buffers is illustrated in [EasyDMA memory layout](#) on page 154.

|            |                 |                 |                 |                 |
|------------|-----------------|-----------------|-----------------|-----------------|
| 0x20000000 | readerBuffer[0] | readerBuffer[1] | readerBuffer[2] | readerBuffer[3] |
| 0x20000004 | readerBuffer[4] | writerBuffer[0] | writerBuffer[1] | writerBuffer[2] |
| 0x20000008 | writerBuffer[3] | writerBuffer[4] | writerBuffer[5] |                 |

Figure 35: EasyDMA memory layout

The WRITER.MAXCNT register should not be specified larger than the actual size of the buffer (writerBuffer). Otherwise, the channel would overflow the writerBuffer.

Once an EasyDMA transfer is completed, the AMOUNT register can be read by the CPU to see how many bytes were transferred. For example, CPU can read MYPERIPHERAL->WRITER.AMOUNT register to see how many bytes WRITER wrote to RAM.

**Note:** The PTR register of a READER or WRITER must point to a valid memory region before use. The reset value of a PTR register is not guaranteed to point to valid memory. See [Memory](#) on page 21 for more information about the different memory regions and EasyDMA connectivity.

### 7.2.1 EasyDMA error handling

Some errors may occur during DMA handling.

If READER.PTR or WRITER.PTR is not pointing to a valid memory region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions.

If several AHB bus masters try to access the same AHB slave at the same time, AHB bus congestion might occur. An EasyDMA channel is an AHB master. Depending on the peripheral, the peripheral may either stall and wait for access to be granted, or lose data.

### 7.2.2 EasyDMA array list

EasyDMA is able to operate in Array List mode.

The Array List mode is implemented in channels where the LIST register is available.

The array list does not provide a mechanism to explicitly specify where the next item in the list is located. Instead, it assumes that the list is organized as a linear array where items are located one after the other in RAM.

The EasyDMA Array List can be implemented by using the data structure `ArrayList_type` as illustrated in the code example below using a READER EasyDMA channel as an example:

```
#define BUFFER_SIZE 4

typedef struct ArrayList
{
    uint8_t buffer[BUFFER_SIZE];
} ArrayList_type;

ArrayList_type ReaderList[3] __at__ 0x20000000;

MYPERIPHERAL->READER.MAXCNT = BUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &ReaderList;
MYPERIPHERAL->READER.LIST = MYPERIPHERAL_READER_LIST_ArrayList;
```

The data structure only includes a buffer with size equal to the size of READER.MAXCNT register. EasyDMA uses the READER.MAXCNT register to determine when the buffer is full.

Figure 36: EasyDMA array list

## 7.3 ACL — Access control lists

The Access control lists (ACL) peripheral is designed to assign and enforce access permissions to different regions of the on-chip flash memory map.

Flash memory regions can be assigned individual ACL permission schemes. The following registers are involved:

- PERM register, where the permissions are configured.
- ADDR register, where the word-aligned start address for the flash page is defined.
- SIZE register, where the size of the region the permissions are applied to is determined.

**Note:** The size of the region in bytes is restricted to a multiple of the flash page size, and the maximum region size is limited to the flash size. See [Memory](#) on page 21 for more information.

Figure 37: Protected regions of on-chip flash memory

There are four defined ACL permission schemes, each with different combinations of read/write permissions, as shown in the following table.

| Read | Write | Protection description                                                  |
|------|-------|-------------------------------------------------------------------------|
| 0    | 0     | No protection. Entire region can be executed, read, written, or erased. |
| 0    | 1     | Region can be executed and read, but not written or erased.             |
| 1    | 0     | Region can be written and erased, but not executed or read.             |
| 1    | 1     | Region is locked for all access until next reset.                       |

Table 23: Permission schemes

**Note:** If a permission violation to a protected region is detected by the ACL peripheral, the request is blocked and a Bus Fault exception is triggered.

Access control to a configured region is enforced by the hardware two CPU clock cycles after the ADDR, SIZE, and PERM registers for an ACL instance have been successfully written. The protection is only enforced if a valid start address of the flash page boundary is written into the ADDR register, and the values of the SIZE and PERM registers are not zero.

The ADDR, SIZE, and PERM registers can only be written once. All ACL configuration registers are cleared on reset (by resetting the device from any reset source), which is also the only way of clearing the configuration registers. To ensure that the desired permission schemes are always enforced by the ACL peripheral, the device boot sequence must perform the necessary configuration.

Debugger read access to a read-protected region will be Read-As-Zero (RAZ), while debugger write access to a write-protected region will be Write-Ignored (WI).

### 7.3.1 Registers

#### Instances

| Instance | Domain  | Base address | TrustZone |     |     | Split access | Description          |
|----------|---------|--------------|-----------|-----|-----|--------------|----------------------|
|          |         |              | Map       | Att | DMA |              |                      |
| ACL      | NETWORK | 0x41080000   | HF        | NS  | NA  | No           | Access control lists |

#### Configuration

| Instance | Domain  | Configuration                                          |
|----------|---------|--------------------------------------------------------|
| ACL      | NETWORK | This ACL can only protect network core's local memory. |

#### Register overview

| Register    | Offset | TZ | Description                                                                                  |
|-------------|--------|----|----------------------------------------------------------------------------------------------|
| ACL[n].ADDR | 0x800  |    | Start address of region to protect. The start address must be word-aligned.                  |
| ACL[n].SIZE | 0x804  |    | Size of region to protect counting from address ACL[n].ADDR. Writing a '0' has no effect.    |
| ACL[n].PERM | 0x808  |    | Access permissions for region n as defined by start address ACL[n].ADDR and size ACL[n].SIZE |

##### 7.3.1.1 ACL[n].ADDR (n=0..7)

Address offset:  $0x800 + (n \times 0x10)$

Start address of region to protect. The start address must be word-aligned.

**Note:** This register can only be written once.

|            |  |  |  | ## 7.4 AAR — Accelerated address resolver

Accelerated address resolver is a cryptographic support function for implementing the Resolvable Private Address Resolution procedure described in *Bluetooth Core Specification*. Resolvable Private Address generation should be achieved using ECB and is not supported by AAR.

The procedure allows two devices that share a secret key to generate and resolve a hash based on their device address. The AAR block enables real-time address resolution on incoming packets when configured as described in this chapter. This allows real-time packet filtering (whitelisting) using a list of known shared keys (Identity Resolving Keys (IRK) in Bluetooth).

### 7.4.1 Shared resources

AAR shares the same AES module as the ECB and CCM peripherals. ECB will always have the lowest priority. If there is a sharing conflict during encryption, the ECB operation will be aborted and an `ERRORECB` event will be generated in the ECB peripheral.

Additionally, AAR shares registers and other resources with the peripherals that have the same ID as AAR. See [Peripherals with shared ID](#) on page 151 for more information.

### 7.4.2 EasyDMA

AAR implements EasyDMA for reading and writing to RAM. EasyDMA will have finished accessing RAM when the `END`, `RESOLVED`, and `NOTRESOLVED` events are generated.

If the [IRKPTR](#) on page 165, [ADDRPTR](#) on page 165, and the [SCRATCHPTR](#) on page 165 is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions.

### 7.4.3 Resolving a resolvable address

A private resolvable address is composed of six bytes according to the *Bluetooth Core Specification*.

Figure 38: Resolvable address

To resolve an address, the register [ADDRPTR](#) on page 165 must point to the start of the packet. The resolver is started by triggering the `START` task. A `RESOLVED` event is generated when AAR manages to resolve the address using one of the Identity Resolving Keys (IRK) found in the IRK data structure. AAR will use the IRK specified in the register `IRK0` to `IRK15` starting from `IRK0`. The register [NIRK](#) on page 165 specifies how many IRKs should be used. The AAR module will generate a `NOTRESOLVED` event if it is not able to resolve the address using the specified list of IRKs.

AAR will go through the list of available IRKs in the IRK data structure and for each IRK try to resolve the address according to the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification*. The time it takes to resolve an address varies due to the location in the list of the resolvable address. The resolution time will also be affected by RAM accesses performed by other peripherals and the CPU. See the [Electrical specifications](#) for more information about resolution time.

AAR only compares the received address to those programmed in the module without checking the address type.

AAR will stop as soon as it has managed to resolve the address, or after trying to resolve the address using `NIRK` number of IRKs from the IRK data structure. AAR will generate an `END` event after it has stopped.

Figure 39: Address resolution with packet preloaded into RAM

## 7.4.4 Example

The following example shows how to chain RADIO packet reception with address resolution using AAR.

AAR may be started as soon as the 6 bytes required by AAR have been received by RADIO and stored in RAM. The ADDRPTR pointer must point to the start of packet.

Figure 40: Address resolution with packet loaded into RAM by RADIO

## 7.4.5 IRK data structure

The IRK data structure is located in RAM at the memory location specified by the IRKPTR register.

| Property | Address offset | Description              |
|----------|----------------|--------------------------|
| IRK0     | 0              | IRK number 0 (16 bytes)  |
| IRK1     | 16             | IRK number 1 (16 bytes)  |
| ..       | ..             | ..                       |
| IRK15    | 240            | IRK number 15 (16 bytes) |

Table 24: IRK data structure overview

## 7.4.6 Registers

### Instances

| Instance | Domain  | Base address | TrustZone |     |     | Split access | Description                  |
|----------|---------|--------------|-----------|-----|-----|--------------|------------------------------|
|          |         |              | Map       | Att | DMA |              |                              |
| AAR      | NETWORK | 0x4100E000   | HF        | NS  | NA  | No           | Accelerated address resolver |

### Register overview

| Register            | Offset | TZ | Description                                                                 |
|---------------------|--------|----|-----------------------------------------------------------------------------|
| TASKS_START         | 0x000  |    | Start resolving addresses based on IRKs specified in the IRK data structure |

## 7.4.7 Electrical specification

### 7.4.7.1 AAR Electrical Specification

| Symbol      | Description                                                                                                                                                                               | Min. | Typ. | Max. | Units   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------|
| $t_{AAR}$   | Address resolution time per IRK. Total time for several IRKs is given as $(1 \mu s + n * t_{AAR})$ , where n is the number of IRKs. (Given priority to the actual destination RAM block). |      |      | 6.1  | $\mu s$ |
| $t_{AAR,8}$ | Time for address resolution of 8 IRKs. (Given priority to the actual destination RAM block).                                                                                              |      |      | 49   | $\mu s$ |

## 7.5 CCM — AES CCM mode encryption

Counter with cipher block chaining - message authentication code (CCM) mode is an authenticated encryption algorithm designed to provide both authentication and confidentiality during data transfer.

AES CCM combines counter (CTR) mode encryption and cipher block chaining - message authentication code (CBC-MAC) authentication. The CCM terminology message authentication code (MAC) is called message integrity check (MIC) in *Bluetooth* terminology, and also in this document.

The CCM block generates an encrypted keystream that is applied to input data using the XOR operation and generates the four byte MIC field in one operation. CCM and RADIO can be configured to work synchronously. CCM will encrypt in time for transmission and decrypt after receiving bytes into memory from RADIO. All operations can complete within the packet RX or TX time. CCM on this device is implemented according to *Bluetooth* requirements and the algorithm as defined in IETF [RFC3610](#), and depends on the AES-128 block cipher. A description of the CCM algorithm can also be found in [NIST Special Publication 800-38C](#). The *Bluetooth* specification describes the configuration of counter mode blocks and encryption blocks to implement compliant encryption for Bluetooth Low Energy.

The CCM block uses EasyDMA to load key counter mode blocks (including the nonce required), and to read/write plain text and cipher text.

Three operations are supported:

- Keystream generation
- Packet encryption
- Packet decryption

All operations are done in compliance with the *Bluetooth* specification.<sup>7</sup>

The following figure illustrates keystream generation followed by encryption or decryption. The shortcut is optional.

<sup>7</sup> *Bluetooth* AES CCM 128-bit block encryption, see *Bluetooth Core specification* version 4.0.

Figure 41: Keystream generation

### 7.5.1 Shared resources

CCM shares the same AES module as the ECB and AAR peripherals. ECB will always have the lowest priority. If there is a sharing conflict during encryption, the ECB operation will be aborted and an `ERRORECB` event will be generated in ECB.

Additionally, CCM shares registers and other resources with other peripherals that have the same ID as CCM. See [Peripherals with shared ID](#) on page 151 for more information.

### 7.5.2 Keystream generation

A new keystream needs to be generated before a new packet encryption or packet decryption operation can start.

A keystream is generated by triggering the KSGEN task. An `ENDKSGEN` event is generated after the keystream has been generated.

Keystream generation, packet encryption, and packet decryption operations utilize the configuration specified in the data structure pointed to by `CNFPTR` on page 179. It is necessary to configure this pointer and its underlying data structure, and register `MODE` on page 178 before the KSGEN task is triggered.

The keystream will be stored in CCM's temporary memory area, specified by the `SCRATCHPTR` on page 180, where it will be used in subsequent encryption and decryption operations.

For default length packets (`MODE.LENGTH = Default`), the size of the generated keystream is 27 bytes. When using extended length packets (`MODE.LENGTH = Extended`), register `MAXPACKETSIZE` on page 180 specifies the length of the keystream to be generated. The length of the generated keystream must be greater than or equal to the length of the subsequent packet payload to be encrypted or decrypted. The maximum length of the keystream in extended mode is 251 bytes, which means that the maximum packet payload size is 251 bytes.

If a shortcut is used between `ENDKSGEN` event and `CRYPT` task, pointers `INPTR` on page 179 and `OUTPTR` on page 179 must also be configured before the KSGEN task is triggered.

### 7.5.3 Encryption

CCM is able to read an unencrypted packet, encrypt it, and append a four byte MIC field to the packet.

During packet encryption, CCM performs the following:

- Reads the unencrypted packet located in RAM address specified in the `INPTR` pointer
- Encrypts the packet
- Appends a four byte long Message Integrity Check (MIC) field to the packet

Encryption is started by triggering the `CRYPT` task with register `MODE` on page 178 set to `Encryption`. An `ENDCRYPT` event is generated when packet encryption is completed.

CCM will also modify the length field of the packet to adjust for the appended MIC field. It adds four bytes to the length and stores the resulting packet in RAM at the address specified in pointer `OUTPTR` on page 179, as illustrated in the figure below.

Figure 42: Encryption

Empty packets (length field is set to 0) will not be encrypted, but instead moved unmodified through CCM.

CCM supports different widths of the length field in the data structure for encrypted packets. This is configured in register **MODE** on page 178.

### 7.5.4 Decryption

CCM is able to read an encrypted packet, decrypt it, authenticate the MIC field, and generate an appropriate MIC status.

During packet decryption, CCM performs the following:

- Reads the encrypted packet located in RAM at the address specified in the INPTR pointer
- Decrypts the packet
- Authenticates the packet's MIC field
- Generates the appropriate MIC status

The packet header (S0) and payload are included in the MIC authentication. Bits in the packet header can be masked away by configuring register **HEADERMASK** on page 181.

Decryption is started by triggering the CRYPT task, by setting the register **MODE** on page 178 to **Decryption**. An ENDCRYPT event will be generated when packet decryption is completed.

CCM modifies the length field of the packet to adjust for the MIC field. It subtracts four bytes from the length and stores the decrypted packet in RAM at the address specified in the **OUTPTR** on page 179 pointer.

CCM is only able to decrypt packet payloads that are at least five bytes long (one byte or more encrypted payload (EPL) and four bytes of MIC). CCM will therefore generate a MIC error for packets where the length field is set to 1, 2, 3, or 4.

Empty packets (length field is set to 0) will not be decrypted but instead moved unmodified through CCM. These packets will always pass the MIC check.

CCM supports different widths of the LENGTH field in the data structure for decrypted packets. This is configured in register **MODE** on page 178.

Figure 43: Decryption

The CCM is only able to decrypt packet payloads that are at least 5 bytes long, 1 byte or more encrypted payload (EPL) and 4 bytes of MIC. The CCM will therefore generate a MIC error for packets where the

length field is set to 1, 2, 3 or 4. Empty packets (length field is set to 0) will not be decrypted, but instead moved unmodified through CCM. These packets will always pass the MIC check.

CCM supports different widths of the length field in the data structure for decrypted packets. This is configured in register [MODE](#) on page 178.

### 7.5.5 AES CCM and RADIO concurrent operation

The CCM peripheral is able to encrypt/decrypt data synchronously to data being transmitted or received by RADIO.

In order for CCM to run synchronously with the radio, the data rate setting in register [MODE](#) on page 178 needs to match the radio data rate. The settings in this register apply whenever either the KSGEN or CRYPT tasks are triggered.

The data rate setting of register [MODE](#) on page 178 can also be overridden on-the-fly during an ongoing encrypt/decrypt operation by the contents of register [RATEOVERRIDE](#) on page 180. The data rate setting in this register applies whenever the RATEOVERRIDE task is triggered. This feature can be useful in cases where the radio data rate is changed during an ongoing packet transaction.

### 7.5.6 Encrypting packets on-the-fly in radio transmit mode

When CCM encrypts a packet on-the-fly while RADIO is transmitting it, RADIO must read the encrypted packet from the same memory location that CCM is writing to.

The [OUTPTR](#) on page 179 pointer in CCM must point to the same memory location as the [PACKETPTR](#) pointer in RADIO, as illustrated in the following figure.

Figure 44: Configuration of on-the-fly encryption

In order to match RADIO's timing, the KSGEN task must be triggered early enough to allow the keystream generation to complete before packet encryption begins.

For short packets (MODE.LENGTH = Default), the KSGEN task must be triggered before or at the same time as the START task in RADIO is triggered. In addition, the shortcut between the ENDKSGEN event and the CRYPT task must be enabled. This use-case is illustrated in [On-the-fly encryption of short packets \(MODE.LENGTH = Default\), using a PPI connection](#) on page 170. It uses a PPI connection between the READY event in RADIO and the KSGEN task in CCM.

For long packets (MODE.LENGTH = Extended), the keystream generation needs to start earlier, such as when the TXEN task in RADIO is triggered.

Refer to [Timing specification](#) on page 181 for information about the time needed for generating a keystream.

Figure 45: On-the-fly encryption of short packets (MODE.LENGTH = Default), using a PPI connection

For long packets (MODE.LENGTH = Extended), the keystream generation will need to be started even earlier, for example at the time when the TXEN task in the radio is triggered.

**Note:** See [Timing specification](#) on page 181 for information about the time needed for generating a keystream.

### 7.5.7 Decrypting packets on-the-fly in RADIO receive mode

When CCM decrypts a packet on-the-fly while RADIO is receiving it, CCM must read the encrypted packet from the same memory location that RADIO is writing to.

The pointer [INPTR](#) on page 179 in CCM must therefore point to the same memory location as the [PACKETPTR](#) pointer in RADIO.

Figure 46: Configuration of on-the-fly decryption

In order to match RADIO's timing, the KSGEN task must be triggered early enough to allow the keystream generation to complete before the decryption of the packet starts.

For short packets (MODE.LENGTH = Default), the KSGEN task must be triggered no later than when the START task in RADIO is triggered. In addition, the CRYPT task must not be triggered earlier than when the ADDRESS event is generated by RADIO. If the CRYPT task is triggered exactly at the same time as the ADDRESS event is generated by RADIO, CCM will guarantee that the decryption is completed no later than when the END event in RADIO is generated. This use case, using a PPI connection between the ADDRESS event in RADIO and the CRYPT task in CCM, is illustrated in figure below.

Figure 47: On-the-fly decryption of short packets (MODE.LENGTH = Default), using a PPI connection

The KSGEN task is triggered from the READY event in RADIO, through a PPI connection.

For long packets (MODE.LENGTH = Extended) the keystream generation will need to start even earlier, such as when the RXEN task in RADIO is triggered.

Refer to [Timing specification](#) on page 181 for information about the time needed for generating a keystream.

## 7.5.8 CCM data structure

The CCM data structure is located in data RAM, at the memory location specified by the CNFPTR pointer register.

| Property | Address offset | Description                                                                                                                   |
|----------|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| KEY      | 0              | 16-byte AES key.                                                                                                              |
| PKTCTR   | 16             | Octet0 (least significant octet (LSO)) of packet. counter                                                                     |
|          | 17             | Octet1 of packet counter.                                                                                                     |
|          | 18             | Octet2 of packet counter.                                                                                                     |
|          | 19             | Octet3 of packet counter.                                                                                                     |
|          | 20             | Bit 6 – bit 0: Octet4 (7 most significant bits of packet counter, with bit 6 being the most significant bit). Bit 7: Ignored. |
|          | 21             | Ignored.                                                                                                                      |
|          | 22             | Ignored.                                                                                                                      |
|          | 23             | Ignored.                                                                                                                      |
|          | 24             | Bit 0: Direction bit. Bit 7 – bit 1: Zero padded.                                                                             |
| IV       | 25             | 8-byte initialization vector (IV). Octet0 (LSO) of IV, Octet1 of IV, ... , Octet7 (MSO) of IV.                                |

Table 25: CCM data structure overview

The NONCE vector (as specified by the *Bluetooth* Core Specification) will be generated by hardware based on the information specified in the CCM data structure.

| Property | Address offset | Description                            |
|----------|----------------|----------------------------------------|
| HEADER   | 0              | Packet header                          |
| LENGTH   | 1              | Number of bytes in unencrypted payload |
| RFU      | 2              | Reserved for future use                |
| PAYLOAD  | 3              | Unencrypted payload                    |

Table 26: Data structure for unencrypted packet

| Property | Address offset     | Description                                                                                                                                        |
|----------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| HEADER   | 0                  | Packet header                                                                                                                                      |
| LENGTH   | 1                  | Number of bytes in encrypted payload including length of MIC<br><br>LENGTH will be 0 for empty packets since the MIC is not added to empty packets |
| RFU      | 2                  | Reserved for future use                                                                                                                            |
| PAYLOAD  | 3                  | Encrypted payload                                                                                                                                  |
| MIC      | 3 + payload length | ENCRYPT: 4 bytes encrypted MIC<br><br>MIC is not added to empty packets                                                                            |

Table 27: Data structure for encrypted packet

## 7.5.9 EasyDMA and ERROR event

The CCM implements an EasyDMA mechanism for reading from and writing to RAM.

When the CPU and EasyDMA enabled peripherals access the same RAM block at the same time, increased bus collisions might disrupt on-the-fly encryption. In this case, the ERROR event will be generated.

EasyDMA stops accessing RAM when the ENDKSGEN and ENDCRYPT events are generated.

If the CNFPTR, SCRATCHPTR, INPTR and the OUTPTR are not pointing to the data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions.

## 7.5.10 Registers

### Instances

| Instance | Domain  | Base address | TrustZone |     |     | Split access | Description                                          |
|----------|---------|--------------|-----------|-----|-----|--------------|------------------------------------------------------|
|          |         |              | Map       | Att | DMA |              |                                                      |
| CCM      | NETWORK | 0x4100E000   | HF        | NS  | NA  | No           | AES counter with CBC-MAC (CCM) mode block encryption |

### Register overview

| Register               | Offset | TZ | Description                                                                                                                     |
|------------------------|--------|----|---------------------------------------------------------------------------------------------------------------------------------|
| TASKS_KSGEN            | 0x000  |    | Start generation of keystream. This operation will stop by itself when completed.                                               |
| TASKS_CRYPT            | 0x004  |    | Start encryption/decryption. This operation will stop by itself when completed.                                                 |
| TASKS_STOP             | 0x008  |    | Stop encryption/decryption                                                                                                      |
| TASKS_RATEOVERRIDE     | 0x00C  |    | Override DATARATE setting in MODE register with the contents of the RATEOVERRIDE register for any ongoing encryption/decryption |
| SUBSCRIBE_KSGEN        | 0x080  |    | Subscribe configuration for task <a href="#">KSGEN</a>                                                                          |

## 7.5.11 Electrical specification

### 7.5.11.1 Timing specification

| Symbol            | Description                                                                           | Min. | Typ. | Max. | Units         |
|-------------------|---------------------------------------------------------------------------------------|------|------|------|---------------|
| $t_{\text{ngen}}$ | Time needed for keystream generation (given priority access to destination RAM block) |      |      | 50   | $\mu\text{s}$ |

## 7.6 COMP — Comparator

The comparator (COMP) compares an input voltage (VIN+) against a second input voltage (VIN-). VIN+ can be derived from an analog input pin (AIN0-AIN7). VIN- can be derived from multiple sources depending on the operation mode of the comparator.

The main features of COMP are the following:

- Input range from 0 V to VDD
- Single-ended mode
  - Fully flexible hysteresis using a 64-level reference ladder
- Differential mode
  - Configurable hysteresis
- Reference inputs (VREF):
  - VDD
  - External reference from AIN0 to AIN7 (between 0 V and VDD)
  - Internal references 1.2 V, 1.8 V, and 2.4 V
- Three speed/power consumption modes:
  - Low-power

- Normal
- High-speed
- Single-pin capacitive sensor support
- Event generation on output changes
  - UP event on  $V_{IN-} > V_{IN+}$
  - DOWN event on  $V_{IN-} < V_{IN+}$
  - CROSS event on  $V_{IN+}$  and  $V_{IN-}$  crossing
  - READY event on core and internal reference (if used) ready

Figure 48: Comparator overview

Once enabled (using the [ENABLE](#) register), the comparator is started by triggering the START task and stopped by triggering the STOP task. The comparator will generate a READY event to indicate when it is ready for use and the output is correct. The delay between START and READY is  $t_{INT\_REF,START}$  if an internal reference is selected, or  $t_{COMP,START}$  if an external reference is used. When the COMP module is started, events will be generated every time  $V_{IN+}$  crosses  $V_{IN-}$ .

## Operation modes

The comparator can be configured to operate in two main operation modes: differential mode and single-ended mode. See the [MODE](#) register for more information. In both operation modes, the comparator can operate in different speed and power consumption modes (low-power, normal and high-speed). High-speed mode will consume more power compared to low-power mode, and low-power mode will result in slower response time compared to high-speed mode.

Use the [PSEL](#) register to select any of the AIN0-AIN7 pins as  $V_{IN+}$  input, regardless of the operation mode selected for the comparator. The source of  $V_{IN-}$  depends on which of the following operation mode are used:

- Differential mode - Derived directly from AIN0 to AIN7
- Single-ended mode - Derived from VREF. VREF can be derived from VDD, AIN0-AIN7 or internal 1.2 V, 1.8 V and 2.4 V references.

The selected analog pins will be acquired by the comparator once it is enabled.

An optional hysteresis on VIN+ and VIN- can be enabled when the module is used in differential mode through the **HYST** register. In single-ended mode, VUP and VDOWN thresholds can be set to implement a hysteresis using the reference ladder (see [Comparator in single-ended mode](#) on page 185). This hysteresis is in the order of magnitude of  $V_{DIFFHYST}$ , and shall prevent noise on the signal to create unwanted events. See [Hysteresis example where VIN+ starts below VUP](#) on page 186 for an illustration of the effect of an active hysteresis on a noisy input signal.

An upward crossing will generate an UP event and a downward crossing will generate a DOWN event. The CROSS event will be generated every time there is a crossing, independent of direction.

The immediate value of the comparator can be sampled to **RESULT** register by triggering the SAMPLE task.

## ISOURCE

An optional configurable current can be applied on the AINx pad currently selected for VIN+, as illustrated in the following figure. The AINx pad is configured in register **PSEL** on page 193 and the current source in register **ISOURCE** on page 195.

Figure 49: Using the configurable current source

Enabling ISOURCE creates a feedback path around the comparator, forming a relaxation oscillator. The circuit will sink current from VIN+ when the comparator output is high, and source current into VIN+ when the comparator output is low. The frequency of the oscillator is dependent on the capacitance at the analog input pin, the reference voltages, and the value of the current source. When using ISOURCE, a capacitive sensor can be attached between the analog input pin and ground. With a selected current of 10  $\mu\text{A}$ , VUP-VDOWN equal to 1 V, and an external capacity of typically 10 pF, the resulting oscillation frequency is around 500 kHz.

The frequency of the oscillator can be calculated using the following equation:

$$f_{\_OSC} = I_{\_SOURCE} / (2C \cdot (VUP - VDOWN))$$

**Note:** The current source can be enabled in any of the comparator modes.

### 7.6.1 Shared resources

The COMP shares analog resources with other analog peripherals.

While it is possible to use the SAADC at the same time as the COMP, selecting the same analog input pin for both peripherals is not supported.

Additionally, COMP shares registers and other resources with other peripherals that have the same ID as the COMP. See [Peripherals with shared ID](#) on page 151 for more information.

The COMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behavior.

### 7.6.2 Differential mode

In differential mode, the reference input VIN- is derived directly from one of the AINx pins.

Before enabling the comparator via the [ENABLE](#) register, the following registers must be configured for the differential mode:

- [PSEL](#)
- [MODE](#)
- [EXTREFSEL](#)

Figure 50: Comparator in differential mode

**Note:** Depending on the device, not all the analog inputs may be available for each MUX. See definitions for [PSEL](#) and [EXTREFSEL](#) for more information about which analog pins are available on a particular device.

When the [HYST](#) register is turned on during this mode, the output of the comparator and associated events do the following:

- Change from ABOVE to BELOW when VIN+ drops below VIN- - ( $V_{DIFFHYST}/2$ )
- Change from BELOW to ABOVE when VIN+ raises above VIN- + ( $V_{DIFFHYST}/2$ )

This behavior is illustrated in the following figure.

Figure 51: Hysteresis enabled in differential mode

### 7.6.3 Single-ended mode

In single-ended mode, VIN- is derived from the reference ladder.

Before enabling the comparator via the **ENABLE** register, the following registers must be configured for the single-ended mode:

- **PSEL**
- **MODE**
- **REFSEL**
- **EXTREFSEL**
- **TH**

The reference ladder uses the reference voltage (VREF) to derive two new voltage references, VUP and VDOWN. VUP and VDOWN are configured using THUP and THDOWN respectively in the **TH** register. VREF can be derived from any of the available reference sources, configured using the **EXTREFSEL** and **REFSEL** registers as shown in the following figure. When AREF is selected in the **REFSEL** register, the **EXTREFSEL** register is used to select one of the AIN0-AIN7 analog input pins as reference input. The selected analog pins will be acquired by the comparator once it is enabled.

Figure 52: Comparator in single-ended mode

**Note:** Depending on the device, not all the analog inputs may be available for each MUX. See definitions for **PSEL** and **EXTREFSEL** for more information about which analog pins are available on a particular device.

When the comparator core detects that  $VIN+ > VIN-$ , i.e. ABOVE as per the **RESULT** register,  $VIN-$  will switch to VDOWN. When  $VIN+$  falls below  $VIN-$  again,  $VIN-$  will be switched back to VUP. By specifying VUP larger than VDOWN, a hysteresis can be generated as illustrated in the following figures.

Writing to **HYST** has no effect in single-ended mode, and the content of this register is ignored.

Figure 53: Hysteresis example where  $VIN+$  starts below VUP

Figure 54: Hysteresis example where  $VIN+$  starts above VUP

## 7.6.4 Registers

### Instances

| Instance  | Domain      | Base address | TrustZone |     |     | Split access | Description |
|-----------|-------------|--------------|-----------|-----|-----|--------------|-------------|
|           |             |              | Map       | Att | DMA |              |             |
| COMP : S  | APPLICATION | 0x5001A000   | US        | S   | NA  | No           | Comparator  |

## 7.6.5 Electrical specification

### 7.6.5.1 COMP Electrical Specification

| Symbol                      | Description                                                                           | Min. | Typ. | Max. | Units         |
|-----------------------------|---------------------------------------------------------------------------------------|------|------|------|---------------|
| $t_{\text{PROPDL,LP}}$      | Propagation delay, Low-power mode <sup>8</sup>                                        |      | 0.6  |      | $\mu\text{s}$ |
| $t_{\text{PROPDL,N}}$       | Propagation delay, Normal mode <sup>8</sup>                                           |      | 0.2  |      | $\mu\text{s}$ |
| $t_{\text{PROPDL,HS}}$      | Propagation delay, High-speed mode <sup>8</sup>                                       |      | 0.1  |      | $\mu\text{s}$ |
| $V_{\text{DIFFHYST}}$       | Optional hysteresis applied to differential input                                     | 26   | 35   | 55   | mV            |
| $V_{\text{VDD-VREF}}$       | Required difference between VDD and a selected VREF, $V_{\text{DD}} > V_{\text{REF}}$ | 0.3  |      |      | V             |
| $t_{\text{INT\_REF,START}}$ | Startup time for the internal bandgap reference                                       |      | 50   | 80   | $\mu\text{s}$ |
| $E_{\text{INT\_REF}}$       | Internal bandgap reference error                                                      | -1.8 | 0    | 0.5  | %             |
| $V_{\text{INPUTOFFSET}}$    | Input offset                                                                          | -10  |      | 10   | mV            |
| $t_{\text{COMP,START}}$     | Startup time for the comparator core                                                  |      | 3    |      | $\mu\text{s}$ |

### 7.6.5.2 COMP Current Source (ISOURCE) Specification

Configurable current provided by the current source, excluding variations over temperature and voltage, at 3 V and 25°C. For other voltages and temperatures, the accuracy as specified by  $I_{\text{SOURCE,ACC}}$  must be added to the min and max values.

| Symbol                  | Description                                          | Min. | Typ. | Max. | Units         |
|-------------------------|------------------------------------------------------|------|------|------|---------------|
| $I_{\text{SOURCE,A}}$   | Current when register ISOURCE=len2mA5                | 1.6  | 2.4  | 3.3  | $\mu\text{A}$ |
| $I_{\text{SOURCE,B}}$   | Current when register ISOURCE=len5mA                 | 3.2  | 4.9  | 6.5  | $\mu\text{A}$ |
| $I_{\text{SOURCE,C}}$   | Current when register ISOURCE=len10mA                | 6.0  | 9.8  | 13.0 | $\mu\text{A}$ |
| $I_{\text{SOURCE,ACC}}$ | Current source accuracy over temperature and voltage |      | ±5%  |      | %             |

## 7.7 CRYPTOCELL — Arm TrustZone CryptoCell 312

Arm TrustZone CryptoCell 312 (CRYPTOCELL) is a security subsystem providing root of trust (RoT) and cryptographic services for a device.

<sup>8</sup> Propagation delay is with 10 mV overdrive.

Figure 55: CRYPTOCELL block diagram

The following cryptographic features are among the functionality that can be supported:

- True random number generator (TRNG) compliant with FIPS 140-2, BSI AIS-31, and NIST 800-90B.
- Pseudorandom number generator (PRNG) using underlying AES engine compliant with NIST 800-90A
- RSA public key cryptography
  - Signature verification up to key sizes of 4096 bits
  - Key generation up to key sizes of 3072 bits
  - PKCS#1 v2.1/v1.5
- Elliptic curve cryptography (ECC)
  - NIST FIPS 186-4 recommended curves using pseudorandom parameters, up to 521 bits:
    - Prime field: P-192, P-224, P-256, P-384, P-521
  - SEC 2 recommended curves using pseudorandom parameters, up to 521 bits:
    - Prime field: secp160r1, secp192r1, secp224r1, secp256r1, secp384r1, secp521r1
  - Koblitz curves using fixed parameters, up to 256 bits:
    - Prime field: secp160k1, secp192k1, secp224k1, secp256k1
  - Brainpool curves:
    - Prime field: BrainpoolP256r1
  - Edwards/Montgomery curves:
    - Ed25519, Curve25519
  - ECDH/ECDSA support
- Secure remote password protocol (SRP), up to 3072 bits operations

- Hashing functions
  - SHA-1, SHA-2 up to 256 bits
  - Keyed-hash message authentication code (HMAC)
- AES symmetric encryption
  - General purpose AES engine (encrypt/decrypt, sign/verify)
  - 128, 192, and 256 bits key size
  - Supported encryption modes: ECB, CBC, CMAC/CBC-MAC, CTR, CCM/CCM\*, GCM
- ChaCha20/Poly1305 symmetric encryption
  - 128 and 256 bits key size
  - Authenticated encryption with associated data (AEAD) mode

### 7.7.1 Disclaimer

This section contains an important disclaimer about the CRYPTOCELL subsystem documentation.

The CRYPTOCELL subsystem is recommended for use with the libraries in the Nordic Semiconductor ASA SDK. These libraries are tested and verified to work with the CRYPTOCELL subsystem hardware. The CRYPTOCELL subsystem documentation and register descriptions are for reference only and can be used for modifying the Nordic supplied SDK libraries or implementing new features.

Nordic Semiconductor ASA reserves the right to change the CRYPTOCELL documentation and register descriptions without further notice. Changes will not trigger erratas and will not be seen as changing form/fit/function of the device.

Please note that Nordic cannot support questions directly related to the register interface or modification of the source code implementation. Nordic provide support for the top-level API in the software library distributed as part of the device SDK.

### 7.7.2 Usage

The CRYPTOCELL subsystem is a hardware and software solution where software is delivered as libraries in Nordic device SDKs. Recommended usage of the CRYPTOCELL subsystem is to use the SDK library implementation available for the device. The CRYPTOCELL subsystem is documented for reference purpose only, please see section [Disclaimer](#) on page 198 for more information.

To enable CRYPTOCELL, use register [ENABLE](#) on page 203. The device will not enter the System ON IDLE mode until CRYPTOCELL has been disabled, see [POWER — Power control](#) on page 46 for more information. The Nordic SDK software library automatically controls enabling and disabling of the CRYPTOCELL subsystem as a part of its function calls.

### 7.7.3 Security configuration

CRYPTOCELL has internal storage for its security configuration, which is preserved even if CRYPTOCELL is disabled.

The following configuration settings are retained:

- Device life cycle state (LCS)
- Various lock bits
- APB filtering configuration

Any reset source will erase the CRYPTOCELL internal storage, see [RESET — Reset control](#) on page 65 for more information.

#### 7.7.3.1 APB filtering

Access permissions for the CRYPTOCELL subsystem APB slave interface can be controlled and locked until the next power-on reset through a register.

For more details, see register [AO\\_APB\\_FILTERING](#) on page 251. The configuration will be stored in the CRYPTOCELL subsystem internal storage until next power-on reset.

## 7.7.4 Cryptographic flow

The following section describe a typical cryptographic flow for the CRYPTOCELL subsystem.

1. Enable CRYPTOCELL subsystem as described in [Usage](#) on page 198.
2. Perform clock control for the desired cryptographic engine(s) as described in [Power and clock](#) on page 200.
3. Configure the desired cryptographic mode as described in [CTL interface](#) on page 252.
4. Depending on the selected cryptographic mode the active engine(s) must be configured, including which cryptographic key to use as described in [Cryptographic key selection](#) on page 199.
5. Optionally configure DMA engines as described in [Direct memory access \(DMA\)](#) on page 200.
6. Initiate the operation, and wait for an event as described in [Interrupt handling](#) on page 201.
7. Check status register(s) for the active engine(s).

## 7.7.5 Cryptographic key selection

The CRYPTOCELL subsystem can operate on different cryptographic keys.

### 7.7.5.1 Session keys

Session keys are supported by the AES, GHASH, and CHACHA engine.

Before starting a cryptographic operation using a session key, the desired key value must be written in clear-text by the CPU into the write-only key registers of the corresponding engine. One session key can be overwritten by another as long as the write order of the write-only key registers are respected. Please refer to the corresponding chapter of each cryptographic engine for more information about write order.

The [AES engine](#) on page 203 supports 128/192/256 bits session keys, [GHASH engine](#) on page 218 supports 128 bits session keys, and [CHACHA engine](#) on page 212 supports 128/256 bits session keys.

The last written session key for each engine is retained until CRYPTOCELL is disabled, the engine is reset, or the device is reset.

### 7.7.5.2 Key Management Unit (KMU) keys

The [KMU — Key management unit](#) on page 343 is designed to securely transfer symmetric encryption keys directly into the dedicated write-only key registers of the AES and CHACHA cryptographic engines upon request from the CPU.

Pushing a symmetric key value stored in a KMU key slot into either the AES or CHACHA engine will replace the need for software to write a session key in clear-text into registers [AES\\_KEY\\_0\[n\] \(n=0..7\)](#) on page 206 and [AES\\_KEY\\_1\[n\] \(n=0..7\)](#) on page 206 for 128/256 bits AES keys or registers [CHACHA\\_KEY\[n\] \(n=0..7\)](#) on page 215 for 128/256 bits CHACHA keys.

The symmetric key value pushed from a KMU key slot into the AES or CHACHA engine will be retained until CRYPTOCELL is disabled or the device is reset.

### 7.7.5.3 Asymmetric keys

Asymmetric cryptographic keys are supported by the PKA engine.

Before starting a cryptographic operation using an asymmetric key, the desired key value must be written into the PKA SRAM together with the payload.

See [PKA engine](#) on page 226 for more information.

## 7.7.6 Internal memories

CRYPTOCELL contains two dedicated memory blocks; one 6 kB SRAM block for the PKA engine calculations, and one 2 kB SRAM block for the RNG engine entropy collector.

See [PKA SRAM](#) on page 231 and [RNG SRAM](#) on page 239 for more information about these dedicated memory blocks.

## 7.7.7 Direct memory access (DMA)

CRYPTOCELL support direct memory access (DMA) to allow cryptographic operations on memory mapped regions without involving the CPU.

The following table indicates which memory is accessible by CRYPTOCELL DMA engines.

| Memory type | Read | Write |
|-------------|------|-------|
| SRAM        | Yes  | Yes   |
| Flash       | Yes  | Yes   |

Table 28: DMA transaction types

Data stored in a memory type not accessible by CRYPTOCELL DMA engines must be copied to an accessible memory type before it can be processed by the CRYPTOCELL subsystem. Maximum DMA transaction size is limited to  $2^{16}-1$  bytes.

The CRYPTOCELL DMA engine can also run in Bypass mode, meaning data is read and written without being piped through a cryptographic engine. Thus CRYPTOCELL can act as a general purpose DMA engine for moving data.

Operating the DMA engines in Bypass mode involve the following steps:

1. Enable DMA engines clock using register [DMA\\_CLK](#) on page 268.
2. Configure cryptographic control for `Bypass` mode using register [CRYPTO\\_CTL](#) on page 252.
3. Set the the output [destination address](#) and [size](#) of the receiving buffer.
4. Start the DMA transaction by configuring the input [source address](#) and the [number of bytes](#) to transfer.
5. Status of the DMA transaction can be monitored by either polling register [DOUT\\_DMA\\_MEM\\_BUSY](#) on page 258, or by unmasking the interrupt for field `DOUT_TO_MEM_MASK` in register [IMR](#) on page 262.

See [DIN DMA engine](#) on page 253 and [DOUT DMA engine](#) on page 257 for more information.

## 7.7.8 Power and clock

Power and clock management of the CRYPTOCELL subsystem is handled automatically in hardware, as long as the necessary conditions are fulfilled by software.

### Clock gating

CRYPTOCELL implements separate clock domains for each cryptographic engine. Internal clock gating control is handled through the [MISC interface](#) on page 266, as well as register [RNG\\_CLK](#) on page 247. The registers of a cryptographic engine are only accessible when its clock is enabled.

### Power gating

CRYPTOCELL must be disabled to ensure lowest possible power consumption when the subsystem is not needed.

The CRYPTOCELL subsystem power is controlled through register [ENABLE](#) on page 203. Even though external clock input is gated away automatically by hardware, the CRYPTOCELL subsystem power will still be enabled. To initiate a full power-down sequence software must perform the following steps:

1. Make sure there are no pending tasks
2. Verify that CRYPTOCELL subsystem is idle using register [HOST\\_CC\\_IS\\_IDLE](#) on page 264.
3. Clear all pending interrupts in register [RNG\\_ICR](#) on page 243 and register [ICR](#) on page 263.
4. Request power-down by writing to register [HOST\\_POWERDOWN](#) on page 265.
5. Disable CRYPTOCELL subsystem using register [ENABLE](#) on page 203.

If the power-down request in step 4 has been issued, the CRYPTOCELL subsystem must be disabled, as outlined in step 5.

### 7.7.9 Interrupt handling

CRYPTOCELL triggers interrupt once processing is complete.

See register [IRR](#) on page 261 for more information on which CRYPTOCELL subsystem components are able to trigger an interrupt request.

To clear the IRQ line when an interrupt has occurred, the relevant interrupt bit in register [ICR](#) on page 263 must be cleared. Interrupt sources can be masked using register [IMR](#) on page 262. If an interrupt source is masked, no interrupt request will be triggered.

In addition if field [RNG\\_INT](#) in register [IRR](#) on page 261 is asserted, the relevant RNG engine interrupt bit in register [RNG\\_ICR](#) on page 243 must be cleared *before* clearing that interrupt bit in register [ICR](#) on page 263 as described above.

The figure below shows how the CRYPTOCELL subsystem interrupt handling is designed and how it is connected to the NVIC module in the CPU.

Figure 56: CRYPTOCELL interrupt handling

### 7.7.10 Standards

Arm TrustZone CryptoCell 312 (CRYPTOCELL) is compliant with the protocol specifications and standards shown in the following table.

| Algorithm family | Identification code    | Document title                                                                                                                                                                                                               |

## 7.7.12 Accelerators

This chapter contains register interfaces for each of the hardware accelerator engines.

### 7.7.12.1 AES engine

The Advanced Encryption Standard (AES) hardware engine is designed according to FIPS197 for use in encrypt/decrypt and sign/verify operations for 128 bits, 192 bits, and 256 bits key sizes.

The following cipher modes are supported:

- ECB
- CBC
- CBC-MAC
- CMAC
- CTR
- CCM
- CCM\*
- GCM
- XEX/XTS
- XCBC-MAC
- OFB

The AES engine supports both non-tunneling and tunneling operations. In tunneling operation the AES engine can process data using one set of Key/Mode/IV values, and then immediately process the result from the first operating using another set of Key/Mode/IV values. This enables the engine to process both a data stream and the corresponding message authentication code (MAC) handling in parallel.

**Note:**

To ensure proper operation when writing 128 bits, 192 bits, and 256 bits AES keys, the write-only key registers of the AES engine must be written in ascending order, starting with:

- `AES_KEY_0[0]`
- `AES_KEY_0[1]`
- `AES_KEY_0[2]`
- `AES_KEY_0[3]`

For 192 bits and 256 bits AES keys, this must be followed by:

- `AES_KEY_0[4]`
- `AES_KEY_0[5]`

For 256 bits AES keys, this must be followed by:

- `AES_KEY_0[6]`
- `AES_KEY_0[7]`

Additionally, for tunneling operations using 128 bits, 192 bits, and 256 bits AES keys, the write-only key registers for the second stage must also be written in ascending order, starting with:

- `AES_KEY_1[0]`
- `AES_KEY_1[1]`
- `AES_KEY_1[2]`
- `AES_KEY_1[3]`

For 192 bits and 256 bits second stage AES tunneling keys, this must be followed by:

- `AES_KEY_1[4]`
- `AES_KEY_1[5]`

For 256 bits second stage AES tunneling keys, this must be followed by:

- `AES_KEY_1[6]`
- `AES_KEY_1[7]`

### 7.7.12.1.1 Cryptographic flow

The following section describe a simple cryptographic flow for this engine.

```
uint8_t buf_dst[16] = { 0 };
uint8_t buf_src[16] = { 0x81, 0x02, 0xF2, 0x40, 0xD5, 0xB9, 0x44, 0x59,
                      0xA2, 0xEB, 0x6F, 0xF2, 0x49, 0xF5, 0xEB, 0x94 };

/* Enable CRYPTOCELL subsystem */
NRF_CRYPTOCCELL->ENABLE = CRYPTOCCELL_ENABLE_ENABLE_Enabled;

/* Enable engine and DMA clock */
NRF_CC_MISC->AES_CLK = CC_MISC_AES_CLK_ENABLE_Enable;
NRF_CC_MISC->DMA_CLK = CC_MISC_DMA_CLK_ENABLE_Enable;

/* Wait until crypto engine is Idle */
while (NRF_CC_CTL->CRYPTO_BUSY == CC_CTL_CRYPTO_BUSY_STATUS_Busy) { }

/* Configure AES as cryptographic flow */
NRF_CC_CTL->CRYPTO_CTL = CC_CTL_CRYPTO_CTL_MODE_AESActive;

/* Configure AES engine control for decryption using ECB mode (default) */
NRF_CC_AES->AES_CONTROL = CC_AES_AES_CONTROL_DEC_KEY0_Decrypt;

/* Load the AES key value into the engine */
NRF_CC_AES->AES_KEY_0[0] = 0x51515151;
NRF_CC_AES->AES_KEY_0[1] = 0x52525252;
NRF_CC_AES->AES_KEY_0[2] = 0x53535353;
NRF_CC_AES->AES_KEY_0[3] = 0x54545454;

/* Configure default init vector */
NRF_CC_AES->AES_IV_0[0] = 0x0;
NRF_CC_AES->AES_IV_0[1] = 0x0;
NRF_CC_AES->AES_IV_0[2] = 0x0;
NRF_CC_AES->AES_IV_0[3] = 0x0;

/* Configure DMA output destination address */
NRF_CC_DOUT->DST_MEM_ADDR = (uint32_t) buf_dst;
NRF_CC_DOUT->DST_MEM_SIZE = (uint32_t) sizeof(buf_dst);

/* Configure DMA input source address to start the cryptographic operation */
NRF_CC_DIN->SRC_MEM_ADDR = (uint32_t) buf_src;
NRF_CC_DIN->SRC_MEM_SIZE = (uint32_t) sizeof(buf_src);

/* Wait on DOUT DMA interrupt */
while (!(NRF_CC_HOST_RGF->IRR & CC_HOST_RGF_IRR_DOUT_TO_MEM_INT_Msk)) { }
```

## 7.7.12.1.2 Registers

### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description           |
|----------|-------------|--------------|-----------|-----|-----|--------------|-----------------------|
|          |             |              | Map       | Att | DMA |              |                       |
| CC_AES   | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL AES engine |

### Register overview

| Register             | Offset | TZ | Description                                                                                                                                                                                                     |
|----------------------|--------|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AES_KEY_0[n]         | 0x400  |    | AES key value to use in non-tunneling operations, or as the first tunnel stage key in tunneling operations. The initial AES_KEY_0[0] register holds the least significant bits [31:0] of the key value.         |
| AES_KEY_1[n]         | 0x420  |    | AES key value to use as the second tunnel stage key in tunneling operations. The initial AES_KEY_1[0] register holds the least significant bits [31:0] of the key value.                                        |
| AES_IV_0[n]          | 0x440  |    | AES Initialization Vector (IV) to use in non-tunneling operations, or as the first tunnel stage IV in tunneling operations. The initial AES_IV_0[0] register holds the least significant bits [31:0] of the IV. |
| AES_IV_1[n]          | 0x450  |    | AES Initialization Vector (IV) to use as the second tunnel stage IV in tunneling operations. The initial AES_IV_1[0] register holds the least significant bits [31:0] of the IV.                                |
| AES_CTR[n]           | 0x460  |    | AES counter (CTR) to use in non-tunneling and tunneling operations. The initial AES_CTR[0] register holds the least significant bits [31:0] of the CTR.                                                         |
| AES_BUSY             | 0x470  |    | Status register for AES engine activity.                                                                                                                                                                        |
| AES_CMAC_INIT        | 0x47C  |    | Writing to this address triggers the AES engine to generate K1 and K2 for AES-CMAC operations.                                                                                                                  |
| AES_REMAINING_BYTES  | 0x4BC  |    | This register should be set with the amount of remaining bytes until the end of the current AES operation.                                                                                                      |
| AES_CONTROL          | 0x4C0  |    | Control the AES engine behavior.                                                                                                                                                                                |
| AES_HW_FLAGS         | 0x4C8  |    | Hardware configuration of the AES engine. Reset value holds the supported features.                                                                                                                             |
| AES_CTR_NO_INCREMENT | 0x4D8  |    | This register enables the AES CTR no increment mode in which the counter mode is not incremented between two blocks                                                                                             |
| AES_SW_RESET         | 0x4F4  |    | Reset the AES engine.                                                                                                                                                                                           |
| AES_CMAC_SIZE0_KICK  | 0x524  |    | Writing to this address triggers the AES engine to perform a CMAC operation with size 0. The CMAC result can be read from the AES_IV_0 register.                                                                |

#### 7.7.12.1.2.1 AES\_KEY\_0[n] (n=0..7)

Address offset:  $0x400 + (n \times 0x4)$

AES key value to use in non-tunneling operations, or as the first tunnel stage key in tunneling operations. The initial AES\_KEY\_0[0] register holds the least significant bits [31:0] of the key value.

|            |  |  |  #### 7.7.12.1.2.2 AES\_KEY\_1[n] (n=0..7)

Address offset:  $0x420 + (n \times 0x4)$

AES key value to use as the second tunnel stage key in tunneling operations. The initial AES\_KEY\_1[0] register holds the least significant bits [31:0] of the key value.

#### 7.7.12.1.2.3 AES\_IV\_0[n] (n=0..3)

Address offset: 0x440 + (n × 0x4)

AES Initialization Vector (IV) to use in non-tunneling operations, or as the first tunnel stage IV in tunneling operations. The initial AES\_IV\_0[0] register holds the least significant bits [31:0] of the IV.

AES\_IV\_0 must be configured according to the selected AES mode:

- AES CBC/CBC-MAC : Loaded with the IV.
- XTS-AES : Loaded with the tweak value 'T'.

This register is a 'R/W change' register, as the written register values changes during processing.

#### 7.7.12.1.2.4 AES\_IV\_1[n] (n=0..3)

Address offset: 0x450 + (n × 0x4)

AES Initialization Vector (IV) to use as the second tunnel stage IV in tunneling operations. The initial AES\_IV\_1[0] register holds the least significant bits [31:0] of the IV.

AES\_IV\_1 must be configured according to the selected AES mode:

- AES CBC/CBC-MAC : Loaded with the IV.
- XTS-AES : Loaded with the tweak value 'T'.

This register is a 'R/W change' register, as the written register values changes during processing.

#### 7.7.12.1.2.5 AES\_CTR[n] (n=0..3)

Address offset: 0x460 + (n × 0x4)

AES counter (CTR) to use in non-tunneling and tunneling operations. The initial AES\_CTR[0] register holds the least significant bits [31:0] of the CTR.

AES\_CTR must be configured according to the selected AES mode:

- AES CTR/GCTR : Loaded with the counter value.
- XTS-AES : Loaded with the 'i' value.

This register is a 'R/W change' register, as the written register values changes during processing.

#### 7.7.12.1.2.7 AES\_CMACE\_INIT

Address offset: 0x47C

Writing to this address triggers the AES engine to generate K1 and K2 for AES-CMAC operations.

|                  |     |        |          |       |                                                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |

#### 7.7.12.1.2.8 AES\_REMAINING\_BYTES

Address offset: 0x4BC

This register should be set with the amount of remaining bytes until the end of the current AES operation.

The AES engine counts down from this value to determine the last block or the block before the last blocks in mode AES CMAC and mode AES CCM.

#### 7.7.12.1.2.13 AES\_CMAC\_SIZE0\_KICK

Address offset: 0x524

Writing to this address triggers the AES engine to perform a CMAC operation with size 0. The CMAC result can be read from the AES\_IV\_0 register.

### 7.7.12.2 CHACHA engine

The ChaCha algorithm is a family of stream ciphers.

The [ChaCha](#) family of stream ciphers can be used as both a stand-alone algorithm, and in combination with the [Poly1305](#) authenticator to form an Authenticated Encryption with Associated Data (AEAD) algorithm as defined in [RFC7539](#) for IETF protocols.

The CHACHA engine provide acceleration for the stream encryption, while the PKA engine is used for acceleration of the Poly1305 authenticator. The core of the ChaCha algorithm is a hash function which is based on rotation operations. In the default configuration the hash function consist of 20 rounds of rotation permutations. The implementation support ChaCha stream ciphers using key sizes up to 256 bits in 8, 12 and 20 rounds. The ChaCha20/Poly1305 combination is perfectly suited for embedded environments, and can achieve much higher throughput than AES using similar power consumption and execution time.

**Note:** To ensure proper operation when writing 128 bits CHACHA keys, the write-only key registers of the CHACHA engine must be written in ascending order, starting with:

- [CHACHA\\_KEY\[0\]](#)
- [CHACHA\\_KEY\[1\]](#)
- [CHACHA\\_KEY\[2\]](#)
- [CHACHA\\_KEY\[3\]](#)

For 256 bits CHACHA keys, this must be followed by:

- [CHACHA\\_KEY\[4\]](#)
- [CHACHA\\_KEY\[5\]](#)
- [CHACHA\\_KEY\[6\]](#)
- [CHACHA\\_KEY\[7\]](#)

### 7.7.12.2.1 Cryptographic flow

The following section describe a simple cryptographic flow for this engine.

```
uint8_t buf_dst[16] = { 0 };
uint8_t buf_src[16] = { 0x18, 0x35, 0x9B, 0x75, 0x18, 0x6F, 0x33, 0xBE,
                      0x22, 0x0A, 0x3D, 0xB7, 0x66, 0xFD, 0x98, 0x35 };

/* Enable CRYPTOCELL subsystem */
NRF_CRYPTOCCELL->ENABLE = CRYPTOCELL_ENABLE_ENABLE_Enabled;

/* Enable engine and DMA clock */
NRF_CC_MISC->CHACHA_CLK = CC_MISC_CHACHA_CLK_ENABLE_Enable;
NRF_CC_MISC->DMA_CLK = CC_MISC_DMA_CLK_ENABLE_Enable;

/* Wait until crypto engine is Idle */
while (NRF_CC_CTL->CRYPTO_BUSY == CC_CTL_CRYPTO_BUSY_STATUS_Busy) { }

/* Configure CHACHA as cryptographic flow */
NRF_CC_CTL->CRYPTO_CTL = CC_CTL_CRYPTO_CTL_MODE_ChaChaActive;

/* Configure testing NONCE */
NRF_CC_CHACHA->CHACHA_IV[0] = 0xB B B B A A A A;
NRF_CC_CHACHA->CHACHA_IV[1] = 0x2 2 2 2 1 1 1 1;

/* Load the CHACHA test key value into the engine */
NRF_CC_CHACHA->CHACHA_KEY[0] = 0x5 1 5 1 5 1 5 1;
NRF_CC_CHACHA->CHACHA_KEY[1] = 0x5 2 5 2 5 2 5 2;
NRF_CC_CHACHA->CHACHA_KEY[2] = 0x5 3 5 3 5 3 5 3;
NRF_CC_CHACHA->CHACHA_KEY[3] = 0x5 4 5 4 5 4 5 4;
NRF_CC_CHACHA->CHACHA_KEY[4] = 0x5 1 5 1 5 1 5 1;
NRF_CC_CHACHA->CHACHA_KEY[5] = 0x5 2 5 2 5 2 5 2;
NRF_CC_CHACHA->CHACHA_KEY[6] = 0x5 3 5 3 5 3 5 3;
NRF_CC_CHACHA->CHACHA_KEY[7] = 0x5 4 5 4 5 4 5 4;

/* Configure CHACHA mode - using default (0x0), adding new message init */
NRF_CC_CHACHA->CHACHA_CONTROL =
    (CC_CHACHA_CHACHA_CONTROL_INIT_Enable <<
     CC_CHACHA_CHACHA_CONTROL_INIT_Pos);

/* Configure DMA output destination address */
NRF_CC_DOUT->DST_MEM_ADDR = (uint32_t) buf_dst;
NRF_CC_DOUT->DST_MEM_SIZE = (uint32_t) sizeof(buf_dst);

/* Configure DMA input source address to start the cryptographic operation */
NRF_CC_DIN->SRC_MEM_ADDR = (uint32_t) buf_src;
NRF_CC_DIN->SRC_MEM_SIZE = (uint32_t) sizeof(buf_src);

/* Wait on DOUT DMA interrupt */
while (!(NRF_CC_HOST_RGF->IRR & CC_HOST_RGF_IRR_DOUT_TO_MEM_INT_Msk)) { }
```

  #### 7.7.12.2.2.4 CHACHA\_IV[n] (n=0..1)

Address offset: 0x3A8 + (n × 0x4)

CHACHA Initialization Vector (IV) to use. The IV is also known as the nonce.

The size of the nonce is controlled from register [CHACHA\\_CONTROL](#) on page 214.

For 64 bits IV size the nonce value must be encoded using:

- CHACHA\_IV[0] : Bits [31:0] of the nonce
- CHACHA\_IV[1] : Bits [63:32] of the nonce

For 96 bits IV size the nonce value must be encoded using:

- [CHACHA\\_BLOCK\\_CNT\\_MSB](#) on page 216 : Bits [31:0] of the nonce
- CHACHA\_IV[0] : Bits [63:32] of the nonce
- CHACHA\_IV[1] : Bits [95:64] of the nonce

#### 7.7.12.2.2.7 CHACHA\_BLOCK\_CNT\_LSB

Address offset: 0x3B8

Store the LSB value of the block counter, in order to support suspend/resume of operation

The two first words (n) in the last row of the cipher matrix are the block counter. At the end of each block (512b), the block counter for the next block is written by HW to register [CHACHA\\_BLOCK\\_CNT\\_LSB](#) on page 216 and register [CHACHA\\_BLOCK\\_CNT\\_MSB](#) on page 216. If starting a new message the block counter must also be reset.

#### 7.7.12.2.2.10 CHACHA\_POLY1305\_KEY[n] (n=0..7)

Address offset: 0x3C4 + (n × 0x4)

The auto-generated key to use in Poly1305 MAC calculation.

The initial CHACHA\_POLY1305\_KEY[0] register holds the least significant bits [31:0] of the key value.

#### 7.7.12.3 GHASH engine

The GHASH engine is suitable for generating Galois hashes for message authentication.

AES in Galois counter mode (AES-GCM) is an authenticated encryption with additional data (AEAD) block cipher mode of operation which provide confidentiality, integrity and authentication of data.

The CRYPTOCELL subsystem is able to perform single-pass AES in galois counter mode (GCM), where the AES engine is used for data confidentiality and the GHASH engine provide data integrity and authentication.

**Note:** To ensure proper operation, the write-only key registers of the GHASH engine must be written in ascending order, starting with:

- GHASH\_SUBKEY[0]
- GHASH\_SUBKEY[1]
- GHASH\_SUBKEY[2]
- GHASH\_SUBKEY[3]

#### Register overview

| Register        | Offset | TZ | Description                                                                                                                  |
|-----------------|--------|----|------------------------------------------------------------------------------------------------------------------------------|
| GHASH_SUBKEY[n] | 0x960  |    | GHASH subkey value to use. The initial GHASH_SUBKEY[0] register holds the least significant bits [31:0] of the subkey value. |
| GHASH_IV[n]     | 0x970  |    | GHASH Initialization Vector (IV) to use. The initial GHASH_IV[0] register holds the least significant bits [31:0] of the IV. |
| GHASH_BUSY      | 0x980  |    | Status register for GHASH engine activity.                                                                                   |
| GHASH_INIT      | 0x984  |    | Configure the GHASH engine for a new GHASH operation.                                                                        |

##### 7.7.12.3.1.1 GHASH\_SUBKEY[n] (n=0..3)

Address offset:  $0x960 + (n \times 0x4)$

GHASH subkey value to use. The initial GHASH\_SUBKEY[0] register holds the least significant bits [31:0] of the subkey value.

|                  |     |       |          |  |       |    |    |    |    |    |    |    |    |    |                     |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |  |

**7.7.12.4 HASH engine**

The HASH engine is designed according to FIPS 180-4, and support both the SHA1 and SHA2 family of digest algorithms up to 256 bits.

The following SHA modes are supported:

- SHA-1
- SHA-224
- SHA-256

**Note:**

To ensure proper operation, the FIPS 180-4 defined initial hash values written to the registers of the HASH engine must be written in descending order, starting with:

- [HASH\\_H\[7\]](#) for SHA-256, and SHA-224.
- [HASH\\_H\[6\]](#) for SHA-256, and SHA-224.
- [HASH\\_H\[5\]](#) for SHA-256, and SHA-224.
- [HASH\\_H\[4\]](#) for SHA-256, SHA-224, and SHA-1.
- [HASH\\_H\[3\]](#) for SHA-256, SHA-224, and SHA-1.
- [HASH\\_H\[2\]](#) for SHA-256, SHA-224, and SHA-1.
- [HASH\\_H\[1\]](#) for SHA-256, SHA-224, and SHA-1.
- [HASH\\_H\[0\]](#) for SHA-256, SHA-224, and SHA-1.

### 7.7.12.4.1 Cryptographic flow

The following section describe a simple cryptographic flow for this engine.

```
uint8_t buf_src[32] = {
    0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA,
    0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA,
    0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA,
    0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA, 0xFA };

/* Enable CRYPTOCELL subsystem */
NRF_CRYPTOCCELL->ENABLE = CRYPTOCCELL_ENABLE_ENABLE_Enabled;

/* Enable engine and DMA clock */
NRF_CC_MISC->HASH_CLK = CC_MISC_HASH_CLK_ENABLE_Enable;
NRF_CC_MISC->DMA_CLK = CC_MISC_DMA_CLK_ENABLE_Enable;

/* Wait until hash engine is Idle */
while (NRF_CC_CTL->HASH_BUSY == CC_CTL_HASH_BUSY_STATUS_Busy) {}

/* Clear all interrupts */
NRF_CC_HOST_RGF->ICR = 0xFFFFFFFF;

/* Configure HASH as cryptographic flow */
NRF_CC_CTL->CRYPTO_CTL = CC_CTL_CRYPTO_CTL_MODE_HashActive;

/* Configure engine for SHA256 */
NRF_CC_HASH->HASH_CONTROL = CC_HASH_HASH_CONTROL_MODE_SHA256;

/* Enable automatic HW padding */
NRF_CC_HASH->HASH_PAD = CC_HASH_HASH_PAD_ENABLE_Enable;
NRF_CC_HASH->HASH_PAD_AUTO = CC_HASH_HASH_PAD_AUTO_HWPAD_Enable;

/* Configure initial SHA256 values */
NRF_CC_HASH->HASH_H[7] = 0x5BE0CD19;
NRF_CC_HASH->HASH_H[6] = 0x1F83D9AB;
NRF_CC_HASH->HASH_H[5] = 0x9B05688C;
NRF_CC_HASH->HASH_H[4] = 0x510E527F;
NRF_CC_HASH->HASH_H[3] = 0xA54FF53A;
NRF_CC_HASH->HASH_H[2] = 0x3C6EF372;
NRF_CC_HASH->HASH_H[1] = 0xBB67AE85;
NRF_CC_HASH->HASH_H[0] = 0x6A09E667;

/* Configure DMA input source address to start the cryptographic operation */
NRF_CC_DIN->SRC_MEM_ADDR = (uint32_t) buf_src;
NRF_CC_DIN->SRC_MEM_SIZE = (uint32_t) sizeof(buf_src);

/* Wait on DIN DMA interrupt indicating data has been fetched */
while (!(NRF_CC_HOST_RGF->IRR & CC_HOST_RGF_IRR_MEM_TO_DIN_INT_Msk)) {}

/* Wait until hash engine is Idle */
while (NRF_CC_CTL->HASH_BUSY == CC_CTL_HASH_BUSY_STATUS_Busy) {}
```

```
/* Calculated SHA256 digest now available in
NRF_CC_HASH->HASH_H[0] to NRF_CC_HASH->HASH_H[7] */
```

## 7.7.12.4.2 Registers

### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description            |
|----------|-------------|--------------|-----------|-----|-----|--------------|------------------------|
|          |             |              | Map       | Att | DMA |              |                        |
| CC_HASH  | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL HASH engine |

### Register overview

| Register        | Offset | TZ | Description                                                                                                                                |
|-----------------|--------|----|--------------------------------------------------------------------------------------------------------------------------------------------|
| HASH_H[n]       | 0x640  |    | HASH_H value registers. The initial HASH_H[0] register holds the least significant bits [31:0] of the value.                               |
| HASH_PAD_AUTO   | 0x684  |    | Configure the HASH engine to automatically pad data at the end of the DMA transfer to complete the digest operation.                       |
| HASH_XOR_DIN    | 0x688  |    | Perform an XOR operation of the DIN DMA engine input data being fed into the HASH engine. Set this register to '0' if XOR is not required. |
| HASH_INIT_STATE | 0x694  |    | Configure HASH engine initial state registers.                                                                                             |
| HASH_SELECT     | 0x6A4  |    | Select HASH or GHASH engine as the digest engine to use.                                                                                   |
| HASH_CONTROL    | 0x7C0  |    | Control the HASH engine behavior.                                                                                                          |
| HASH_PAD        | 0x7C4  |    | Enable the hardware padding feature of the HASH engine.                                                                                    |
| HASH_PAD_FORCE  | 0x7C8  |    | Force the hardware padding operation to trigger if the input data length is zero bytes.                                                    |
| HASH_CUR_LEN_0  | 0x7CC  |    | Bits [31:0] of the number of bytes that have been digested so far.                                                                         |
| HASH_CUR_LEN_1  | 0x7D0  |    | Bits [63:32] of the number of bytes that have been digested so far.                                                                        |
| HASH_HW_FLAGS   | 0x7DC  |    | Hardware configuration of the HASH engine. Reset value holds the supported features.                                                       |
| HASH_SW_RESET   | 0x7E4  |    | Reset the HASH engine.                                                                                                                     |
| HASH_ENDIANNESS | 0x7E8  |    | Configure the endianness of HASH data and padding generation.                                                                              |

#### 7.7.12.4.2.1 HASH\_H[n] (n=0..7)

Address offset:  $0x640 + (n \times 0x4)$

HASH\_H value registers. The initial HASH\_H[0] register holds the least significant bits [31:0] of the value.

This register is a 'R/W change' register, as the written register values changes during processing.

|            |  |  |  |  #### 7.7.12.4.2.2 HASH\_PAD\_AUTO

Address offset: 0x684

Configure the HASH engine to automatically pad data at the end of the DMA transfer to complete the digest operation.

This feature can only be used if [HASH\\_PAD](#) on page 224 is enabled, and must be disabled after a digest operation is completed. In the event of zero bytes input data length the hardware padding must be manually triggered using register [HASH\\_PAD\\_FORCE](#) on page 224.

#### 7.7.12.4.2.3 HASH\_XOR\_DIN

Address offset: 0x688

Perform an XOR operation of the DIN DMA engine input data being fed into the HASH engine. Set this register to '0' if XOR is not required.

|                  |     |       |  |          |       |  |  |  |  |                                                   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |   |   |

#### 7.7.12.4.2.4 HASH\_INIT\_STATE

Address offset: 0x694

Configure HASH engine initial state registers.

Data fetched using the DIN DMA engine will be loaded into initial hash value registers [HASH\\_H\[n\]](#) ( $n=0..7$ ) on page 222 or used as IV for AES MAC.

|                  |     |       |          |       |    |                                                                                    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |  |  |  |

#### 7.7.12.4.2.8 HASH\_PAD\_FORCE

Address offset: 0x7C8

Force the hardware padding operation to trigger if the input data length is zero bytes.

This feature can only be used if [HASH\\_PAD](#) on page 224 is enabled, and must be disabled after a digest operation is completed.

### 7.7.12.5 PKA engine

The Public Key Accelerator (PKA) engine is designed to accelerate asymmetric cryptographic algorithms.

The PKA design is a general purpose bignum modular ALU capable of supporting operand sizes between 128-4160 bits in the following operations:

- Modular exponentiation/inversion
- Modular/regular addition/subtraction
- Modular/regular increment/decrement
- Modular/regular multiplication/division
- Logical operations (AND, OR, XOR, SHIFT)

The PKA engine can be used to hardware accelerate various arithmetic regular and modular mathematical operations involving very large numbers which are used in both RSA and Elliptic Curve Cryptographic (ECC) public-key cryptosystems.

#### 7.7.12.5.1 Virtual memory mapping

The PKA engine uses virtual register mapping to facilitate flexible data management across a variety of cryptographic algorithms.

Figure 57: Virtual register mapping

All virtual registers must be defined and configured in the dedicated **PKA SRAM** on page 231 before they can be accessed by the PKA engine during processing. This SRAM acts as a private memory pool for the PKA engine, where all other access is blocked during processing. The virtual registers are used as input for the PKA calculation and as a placeholder for intermediate and final results.

The PKA engine can be configured to perform multiple operations on virtual operand registers and store the result of the operation in a virtual result or intermediate result register. During the next iteration the PKA engine can then use an intermediate result register from a previous operation as a virtual operand register for further calculations. This re-mapping strategy enables the PKA engine to efficiently handle complex cryptographic operations.

In total there are 32 virtual registers that can be mapped to different PKA SRAM regions using register **MEMORY\_MAP[n]** ( $n=0..31$ ) on page 233, denoted as virtual register R0 - R31. Four of these 32 virtual registers are special registers, and their register index mapping can be changed using register **N\_NP\_T0\_T1\_ADDR** on page 234:

- N - holds the modulus number, by default mapped to virtual register R0. This register is used by the PKA engine for modular operations, and its modulus N value does not change during processing.
- Np - holds the inverse modulus number, by default mapped to virtual register R1. This register is used by the PKA engine for the Barrett reduction algorithm, and its inverse modulus Np value does not change during processing.
- T0 - temporary register, by default mapped to virtual register R30. This register is for internal use by the PKA engine.
- T1 - temporary register, by default mapped to virtual register R31. This register is for internal use by the PKA engine.

All virtual registers must be 64 bits word size aligned, and the size of the virtual registers must be at least the size of the largest operand plus an extra 64 bits for internal PKA calculations. These extra 64 bits must

be initialized to zero. This is applicable for all virtual registers R0 - R31. The configured virtual register size does not define the size of the operation, it only limits the largest operand size that can be used with the corresponding virtual register.

The memory map configuration can be altered dynamically by the PKA engine, depending on the operation. Not all virtual registers need to be configured for each operation. It is recommended to re-write the memory map configuration after a reset.

#### 7.7.12.5.2 Engine operations

The PKA engine can perform multiple operations on operands stored in virtual registers.

PKA processing is triggered by writing to register **OPCODE** on page 234. This register contains both the PKA operation to perform, and which virtual register indexes to use as operand inputs, tag, and intermediate or final result output of the operation. Register **PKA\_DONE** on page 236 will indicate *Processing* until the PKA operation is done, after which the result can be read from the result register in PKA SRAM.

The following OPCODE virtual register indexes must be configured prior to starting the PKA engine:

- Field **REG\_R** configure which virtual register to use for storing an intermediate or final result.
- Field **REG\_A** and **REG\_B** configure which virtual registers to use as operand input. The operand input fields can be interpreted by the PKA engine as constants instead of virtual register indexes by setting fields **CONST\_A** and **CONST\_B** for certain operations, as documented in the table below.
- The size of the operands are set in field **LEN**, which must point to one of the pre-configured operand sizes in bits configured in register **PKA\_L[n]** ( $n=0..7$ ) on page 235.

##### 7.7.12.5.2.1 OPCODE overview

Supported PKA operation codes and the corresponding required virtual register configurations.

| OPCODE        | Operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| ModMul    | Modular Multiply.<br>$REG\_R = (REG\_A * REG\_B) \% REG\_N$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ModMulN   | The output of this operation is a number that is potentially larger than the modulus N, but guaranteed to be smaller than 2N. Assuming REG_A and REG_B are already reduced modulo N or are less than N, the operation is simply $REG\_R = (REG\_A * REG\_B)$ .                                                                                                                                                                                                                                                                                                                                      |
| ModExp    | Modular Exponentiation.<br>$REG\_R = (REG\_A ^ REG\_B) \% REG\_N$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Division  | Integer Division. This operation performs integer division of the value in REG_A by the value in REG_B. The quotient of the division is stored in REG_R, and the remainder is stored back in REG_A. <ul style="list-style-type: none"> <li><math>REG\_R = REG\_A / REG\_B</math></li> <li><math>REG\_A = REG\_A \% REG\_B</math></li> </ul> <p>If REG_B is zero (0x0), the operation is invalid, and the divide by zero bit in the status register is set to indicate a division error.</p> <p><b>Note:</b> PKA division operations with operands larger than 4K bits return erroneous results.</p> |
| ModInv    | Modular Inversion.<br>$REG\_R = 1/REG\_B \% REG\_N$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ModDiv    | Modular division is done by calculating the modular inverse of the divisor, check that the inverse value exists by examining the GCD, and then use modular multiplication to multiply the inverse result by the divided.<br>$REG\_A = (REG\_A * REG\_B^{(-1)}) \% REG\_N$                                                                                                                                                                                                                                                                                                                           |
| MulHigh   | Multiply High. This operation multiplies REG_A by REG_B and captures the high-order bits of the result that exceed the operand size. It places these significant bits, along with an additional PKA_WORD number of bits, into the destination register REG_R.<br>$REG\_R = (REG\_A * REG\_B) \gg \text{operand size}$                                                                                                                                                                                                                                                                               |
| ModMLAC   | Modular Multiplication Acceleration. Performs a modular multiplication and addition. REG_C is defined using the operation tag.<br>$REG\_R = (REG\_A * REG\_B) + REG\_C \% REG\_N$                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ModMLACNR | Modular Multiplication Acceleration No Reduction. Same as ModMLAC, but this omits the final reduction of the result.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Reduction | Reduction. This operation performs a modular reduction, where the result REG_R is the remainder of REG_A divided by REG_N. The length of the operation is flexible and can be chosen based on the specific requirements of the use case.<br>$REG\_R = REG\_A \% REG\_N$                                                                                                                                                                                                                                                                                                                             |

Table 30: PKA OPCODE descriptions

### 7.7.12.5.3 Pipeline configuration

The following section describe how the PKA engine is used to accelerate asymmetric cryptographic algorithms.

The PKA engine supports pipelined operations; the pipeline depth is one opcode, thus the next operation can be set up while the previous operation is executing. Register [PKA\\_PIPE](#) on page 236 will indicate if the pipeline is ready for a new opcode and register [PKA\\_DONE](#) on page 236 will indicate when the PKA operation has been completed and no operation is waiting in the pipeline.

1. Enable CRYPTOCELL subsystem as described in [Cryptographic flow](#) on page 199.
2. Initialize the PKA engine to accommodate the maximum bit size of all intended operations
  - a. Configure registers [PKA\\_L\[n\] \(n=0..7\)](#) on page 235 for all required operand bit sizes. The desired operand length is selected using field LEN in register [OPCODE](#) on page 234.
  - b. Define the PKA SRAM memory map partitioning using register [MEMORY\\_MAP\[n\] \(n=0..31\)](#) on page 233 for register N, Np, T0, and T1, as well as any other virtual registers intended to be used in the operations. The PKA SRAM memory map partitioning must allow for the max operand bit size plus an additional 64 bits reserved for PKA engine internal calculations.

### 3. For all operations

- a. Load the PKA SRAM virtual registers  $N$  and  $N_p$  as required
  - b. Load the remaining PKA SRAM virtual registers as required
  - c. Execute the operation by writing register [OPCODE](#) on page 234
  - d. Prepare the next opcode once register [PKA\\_PIPE](#) on page 236 is ready.
  - e. Handle any status bits in register [PKA\\_STATUS](#) on page 235
  - f. Re-use intermediate results of the previous operation as needed.
4. Wait for the operation to complete by either polling register [PKA\\_DONE](#) on page 236, or by unmasking the interrupt for field [PKA\\_MASK](#) in register [IMR](#) on page 262
  5. Read the result from the result register.

#### 7.7.12.5.4 PKA SRAM

The 6 kB PKA SRAM memory connected to the PKA engine is used exclusively by the engine during cryptographic operations. All access to this memory is blocked while the PKA engine is processing.

The PKA SRAM memory is not directly mapped to the device memory map. Instead, any read or write operation to this memory region must be done using the [PKA engine](#) on page 226.

Writing data to the PKA SRAM involves the following steps:

1. **Set the Address Offset:** Specify the starting byte address for writing by setting register [PKA\\_SRAM\\_WADDR](#) on page 236. An offset value of  $0 \times 0$  points to the first 32-bits word in the PKA SRAM memory. An offset value of  $0 \times 10$  points to the fourth 32-bits word in the PKA SRAM memory.
2. **Write Data:** After setting the address offset, data is written to register [PKA\\_SRAM\\_WDATA](#) on page 237. The address will automatically increment after each write, allowing writes to the next word without needing to set the offset again.

Reading data from the PKA SRAM involves the following steps:

1. **Set the Read Address:** Specify the starting byte address for reading by setting register [PKA\\_SRAM\\_RADDR](#) on page 237
2. **Read Data:** Retrieve the data from register [PKA\\_SRAM\\_RDATA](#) on page 237. Similar to the write address, the read address will auto-increment with each read, setting it to the next word.

**Note:** Before switching from writing to reading operations (or vice versa), the PKA SRAM write buffer must be cleared. This is done using register [PKA\\_SRAM\\_WCLEAR](#) on page 237. Clearing the buffer ensures that the next operation starts cleanly without any leftover data from the previous operation.

### 7.7.12.5.5 Cryptographic flow

The following section describe a simple cryptographic flow for this engine.

```

/* Enable CRYPTOCELL and its PKA engine */
NRF_CRYPTOCCELL->ENABLE = CRYPTOCELL_ENABLE_ENABLE_Enabled;
NRF_CC_MISC->PKA_CLK = CC_MISC_PKA_CLK_ENABLE_Enable;

/* Define the operand bit size as 2048 */
NRF_CC_PKA->PKA_L[1] = 0x800;

/* Define the 32-bits PKA SRAM address of the selected R4 and R5 */
NRF_CC_PKA->MEMORY_MAP[4] = 0x108;
NRF_CC_PKA->MEMORY_MAP[5] = 0x14A;

/* Initialize the SRAM registers with one word of data */
NRF_CC_PKA->PKA_SRAM_WADDR = NRF_CC_PKA->MEMORY_MAP[4];
NRF_CC_PKA->PKA_SRAM_WDATA = 0x5;
NRF_CC_PKA->PKA_SRAM_WADDR = NRF_CC_PKA->MEMORY_MAP[5];
NRF_CC_PKA->PKA_SRAM_WDATA = 0x2;

/* Execute subtract, OPCODE SubDecNeg: R4 = R4 - R5 */
NRF_CC_PKA->OPCODE =
    (4 << CC_PKA_OPCODE_REG_R_Pos) |
    (5 << CC_PKA_OPCODE_REG_B_Pos) |
    (4 << CC_PKA_OPCODE_REG_A_Pos) |
    (1 << CC_PKA_OPCODE_LEN_Pos) |
    (CC_PKA_OPCODE_OPCODE_SubDecNeg << CC_PKA_OPCODE_OPCODE_Pos);

/* Wait for operation to complete, result will be in R4 */
while (!NRF_CC_PKA->PKA_DONE) { }

```

This cryptographic flow example perform a subtract operation with the following assumptions:

- All PKA SRAM registers, including the special virtual registers N, N<sub>p</sub>, T0, and T1, have been cleared before the operation is run.
- The operation is using index 1 in register [PKA\\_L\[n\] \(n=0..7\)](#) on page 235, which is set to accommodate an operand size of 2048 bits.
- Register R4 and R5 have been selected to run this operation. Register R4 is used both as the operand A register and the result register.
- The memory map is configured to allow operands of 2048 bits plus an additional 64 bits for the internal PKA engine calculations. The configuration of the [MEMORY\\_MAP\[n\] \(n=0..31\)](#) on page 233 for virtual register N, N<sub>p</sub>, T0, and T1 is not included in the example. The memory map is thus configured with 66 words per register, leading to the following:

| Virtual register | Memory map register | PKA SRAM address |
|------------------|---------------------|------------------|
| N (R0)           | MEMORY_MAP[0]       | 0x0              |
| Np (R1)          | MEMORY_MAP[1]       | 0x42             |
| ...              | ...                 | ...              |
| R4               | MEMORY_MAP[4]       | 0x108            |
| R5               | MEMORY_MAP[5]       | 0x14A            |
| ...              | ...                 | ...              |

### 7.7.12.5.6 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description           |
|----------|-------------|--------------|-----------|-----|-----|--------------|-----------------------|
|          |             |              | Map       | Att | DMA |              |                       |
| CC_PKA   | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL PKA engine |

#### Register overview

| Register        | Offset | TZ | Description                                                                                                                                                               |
|-----------------|--------|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEMORY_MAP[n]   | 0x0    |    | Register for mapping the virtual register R[n] to a physical address in the PKA SRAM.                                                                                     |
| OPCODE          | 0x80   |    | Operation code to be executed by the PKA engine.<br><br>Writing to this register triggers the PKA operation.                                                              |
| N_NP_T0_T1_ADDR | 0x84   |    | This register defines the N, Np, T0, and T1 virtual register index.                                                                                                       |
| PKA_STATUS      | 0x88   |    | This register holds the status for the PKA pipeline.                                                                                                                      |
| PKA_SW_RESET    | 0x8C   |    | Reset the PKA engine.                                                                                                                                                     |
| PKA_L[n]        | 0x90   |    | This register holds the operands bit size.                                                                                                                                |
| PKA_PIPE        | 0xB0   |    | Status register indicating if the PKA pipeline is ready to receive a new OPCODE.                                                                                          |
| PKA_DONE        | 0xB4   |    | Status register indicating if the PKA operation has been completed.                                                                                                       |
| PKA_VERSION     | 0xC4   |    | PKA engine HW version. Reset value holds the version.                                                                                                                     |
| PKA_SRAM_WADDR  | 0xD4   |    | Start address in PKA SRAM for subsequent write transactions.                                                                                                              |
| PKA_SRAM_WDATA  | 0xD8   |    | Write data to PKA SRAM. Writing to this register triggers a DMA transaction writing data into PKA SRAM. The DMA address offset is automatically incremented during write. |
| PKA_SRAM_RDATA  | 0xDC   |    | Read data from PKA SRAM. Reading from this register triggers a DMA transaction read data from PKA SRAM. The DMA address offset is automatically incremented during read.  |
| PKA_SRAM_WCLEAR | 0xE0   |    | Register for clearing PKA SRAM write buffer.                                                                                                                              |
| PKA_SRAM_RADDR  | 0xE4   |    | Start address in PKA SRAM for subsequent read transactions.                                                                                                               |

#### 7.7.12.5.6.1 MEMORY\_MAP[n] (n=0..31)

Address offset:  $0x0 + (n \times 0x4)$

Register for mapping the virtual register R[n] to a physical address in the PKA SRAM.

|                  |     |       |  |          |       |    |    |    |    |    |    |    |    |    |                                                          |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

**7.7.12.5.6.10 PKA\_SRAM\_WADDR**

Address offset: 0xD4

Start address in PKA SRAM for subsequent write transactions.

#### 7.7.12.5.6.11 PKA SRAM WDATA

Write data to PKA SRAM. Writing to this register triggers a DMA transaction writing data into PKA SRAM. The DMA address offset is automatically incremented during write.

#### 7.7.12.5.6.12 PKA SRAM RDATA

Read data from PKA SRAM. Reading from this register triggers a DMA transaction read data from PKA SRAM. The DMA address offset is automatically incremented during read.

#### 7.7.12.5.6.13 PKA\_SRAM\_WCLEAR

Register for clearing PKA SRAM write buffer.

#### 7.7.12.5.6.14 PKA SRAM RADDR

Start address in PKA SRAM for subsequent read transactions.

### 7.7.12.6 RNG engine

CRYPTOCELL implements a Random Number Generator (RNG) engine which uses a True Random Number Generator (TRNG) for its entropy collection.

The TRNG is a full entropy design compliant with:

- FIPS 140-2: *Security requirements for Cryptographic Modules*
- BSI AIS-31: *Functionality Classes and Evaluation Methodology for True Random Number Generators*
- NIST SP 800-90B: *Recommendation for the Entropy Sources Used for Random Bit Generation*

where a ring-oscillator is used as the noise source.

The entropy collected using the RNG engine can in turn be used for seeding a Pseudo Random Number Generator (PRNG) as defined in NIST SP 800-90A: *Recommendation for Random Number Generation Using Deterministic Random Bit Generators*.

NIST SP 800-90A define three Deterministic Random Bit Generator (DRBG) that are considered cryptographically secure pseudorandom number generators for use in cryptography: Hash DRBG, HMAC DRBG, and CTR DRBG.

The CRYPTOCELL DRBG implementation is a combination of hardware and software, where CTR DRBG is implemented using the the AES engine running AES encryption in counter (CTR) mode as the underlying cipher. This DRBG instance is seeded with random entropy from the RNG engine.

#### 7.7.12.6.1 Ring oscillator length configuration

The RNG engine must be configured with specific parameters to ensure correct operation in order to output random bits with sufficient entropy.

The noise source used for collecting entropy is based on inverter timing jitter that is collected from a dedicated on-chip free-running ring oscillator. The ring oscillator length, i.e. the number of inverters in the chain, can be configured using register [TRNG\\_CONFIG](#) on page 244.

In total there are four different ring oscillator lengths that can be selected, referred to as ROSC1 through ROSC4. For each of these four configurable lengths a corresponding sample count value is provided in register [TRNG90B.ROSC1](#) on page 127 through register [TRNG90B.ROSC4](#) on page 128.

The sampling frequency is configured using register [SAMPLE\\_CNT](#) on page 245, and the programmed value defines the number of CPU clock cycles between two consecutive ring oscillator samples. The configured sample count value is the minimum number of clock cycles that is enough to get independent outputs from the ring oscillator and must match that of the configured ROSC length.

The following steps describe how to set the RNG engine parameters described above:

1. Enable RNG engine clock using register [RNG\\_CLK](#) on page 247.
2. Reset the RNG engine using register [RNG\\_SW\\_RESET](#) on page 246.
3. Re-enable RNG engine clock and select a device-specific sample count from registers [TRNG90B.ROSC1](#) on page 127 through [TRNG90B.ROSC4](#) on page 128 starting with the smallest one, and program the value into register [SAMPLE\\_CNT](#) on page 245.
4. Perform a readback of the selected sample count value.
5. Set the corresponding ROSC length in register [TRNG\\_CONFIG](#) on page 244 to match the selected sample count selection.
6. Enable the noise source using register [NOISE\\_SOURCE](#) on page 244.
7. Wait until event [EHR\\_VALID\\_INT](#) in register [RNG\\_ISR](#) on page 243 trigger to indicate successful collection of 192 bits of random data. The result can be read from registers [EHR\\_DATA\[n\]](#) ( $n=0..5$ ) on page 244.
8. If events [AUTOCORR\\_ERR\\_INT](#), [CRNGT\\_ERR\\_INT](#), or [VNC\\_ERR\\_INT](#) in register [RNG\\_ISR](#) on page 243 trigger, the RNG engine must be re-configured starting from step 2 above. Increase the ROSC length by a factor of one, and pick the corresponding sample count value from FICR. This step must be

repeated until the collection of 192 bits of random data can be collected without an error event being triggered.

It is recommended to always try the shortest ROSC length first, allowing the RNG engine to complete the entropy collection in a shorter time and keep the ring oscillator turned off for longer periods in order to save power.

#### 7.7.12.6.2 RNG SRAM

The 2 kB SRAM memory connected to the RNG engine can be used for storing a large pool of random entropy.

The RNG SRAM memory is not directly mapped to the device memory map. Instead, any read or write operation using word granularity to this memory region must be done using [RNG SRAM interface](#) on page 265. Larger payloads than word granularity can be processed using the [DIN DMA engine](#) on page 253 and [DOUT DMA engine](#) on page 257.

Before any RNG SRAM read or write transaction can be performed, the CRYPTOCELL must be enabled.

Writing data to the RNG SRAM involves the following steps:

1. **Set the Address Offset:** Specify the starting byte address for writing by setting register [SRAM\\_ADDR](#) on page 266. An offset value of  $0 \times 0$  points to the first 32-bits word in the RNG SRAM memory. An offset value of  $0 \times 10$  points to the fourth 32-bits word in the RNG SRAM memory.
2. **Write Data:** When register [SRAM\\_DATA\\_READY](#) on page 266 indicates DMA engine is idle, data is written to register [SRAM\\_DATA](#) on page 266. The address will automatically increment after each write, allowing writes to the next word without needing to set the offset again.

Reading data from the RNG SRAM involves the following steps:

1. **Set the Read Address:** Specify the starting byte address for reading by setting register [SRAM\\_ADDR](#) on page 266
2. **Discard first read:** Read and discard the first value from register [SRAM\\_DATA](#) on page 266, as it will contain the previous value pointed to by register [SRAM\\_ADDR](#) on page 266.
3. **Read Data:** When register [SRAM\\_DATA\\_READY](#) on page 266 indicates DMA engine is idle, retrieve the data from register [SRAM\\_DATA](#) on page 266. Similar to the write address, the read address will auto-increment with each read, setting it to the next word.

**Note:** Once the address register reaches the last RNG SRAM address, the automatic address incrementation halts. Any subsequent read or write transaction will cause the DMA engine to continue operating on the last 32-bits word in the RNG SRAM memory.

#### 7.7.12.6.3 TRNG hardware tests

The RNG engine has a number of built-in hardware tests for making sure the collected entropy from the TRNG is of sufficient quality.

Figure 58: CRYPTOCELL True Random Number Generator

The TRNG collects random bits from the noise source according to the programmed sample counter value in register [SAMPLE\\_CNT](#) on page 245. The sampled bits are post-processed in a von Neumann corrector (VNC) before being subjected to a continuous random number generation test (CRNGT) and autocorrelation test.

192 bits of random data can be read from the entropy holding registers `EHR_DATA[n]` ( $n=0..5$ ) on page 244 once interrupt `EHR_VALID_INT` in register `RNG_ISR` on page 243 trigger. If this interrupt is masked away in register `RNG_IMR` on page 242, the status register `TRNG_VALID` on page 244 contains field `EHR_DATA` which can be polled when the random data is valid. Reading the most significant word from `EHR_DATA` registers will reset register `TRNG_VALID` and a new 192 bits collection period will start.

**Note:**

To ensure proper operation when reading 192 bits of random data from the `EHR_DATA` registers of the RNG engine the data must be read in ascending order, starting with:

- `EHR_DATA[0]`
- `EHR_DATA[1]`
- `EHR_DATA[2]`
- `EHR_DATA[3]`
- `EHR_DATA[4]`
- `EHR_DATA[5]`

#### 7.7.12.6.3.1 von Neumann Corrector

The von Neumann Corrector (VNC) is designed to balance the succession of '1' and '0' bits being output by the TRNG noise source.

The input bits to the VNC is tested for bit equality, meaning a sequence of 32 consecutive bits with the same bit value will trigger event `VNC_ERR_INT` in register `RNG_ISR` on page 243.

If no error event is triggered, the input bits will be balanced using the VNC as shown in the figure below, and the resulting output bits will be subjected to additional TRNG tests. The VNC produce output only if the noise source is active, see register `NOISE_SOURCE` on page 244.

Figure 59: CRYPTOCELL von Neumann corrector

The VNC statistically output one bit for each 4 input bits sampled, meaning the average output rate of the TRNG is  $1 / (\text{SAMPLE\_CNT} * 4)$  bits per CPU clock cycle.

#### 7.7.12.6.3.2 Continuous random number generation test

The Continuous random number generation test (CRNGT) process the balanced output of random data from the von Neumann corrector.

In the event that two consecutive blocks of 16 collected bits are equal, the CRNGT will trigger event `CRNGT_ERR_INT` in register `RNG_ISR` on page 243.

#### 7.7.12.6.3.3 Autocorrelation test

The Autocorrelation test determine if there over time is a bias in the random bit sequences towards certain values or patterns, or if the bits in the sequence are truly independent.

If a bias in the collected bit stream is detected, the output will be discarded and the error flagged in register [AUTOCORR\\_STATISTIC](#) on page 245. If a bias is detected four consecutive times in a row, the autocorrelation test will trigger event [AUTOCORR\\_ERR\\_INT](#) in register [RNG\\_ISR](#) on page 243. In this situation the TRNG will cease to function until manually reset using register [RNG\\_SW\\_RESET](#) on page 246.

#### 7.7.12.6.4 Cryptographic flow

The following section describe a simple cryptographic flow for this engine.

```
/* Enable CRYPTOCELL subsystem */
NRF_CRYPTOCELL->ENABLE = CRYPTOCELL_ENABLE_ENABLE_Enabled;

/* Enable engine clock */
NRF_CC_RNG->RNG_CLK = CC_RNG_RNG_CLK_ENABLE_Enable;

/* Reset engine */
NRF_CC_RNG->RNG_SW_RESET = CC_RNG_RNG_SW_RESET_RESET_Enable;

/* Configure sampling rate between consecutive bits */
do {
    NRF_CC_RNG->RNG_CLK = CC_RNG_RNG_CLK_ENABLE_Enable;
    NRF_CC_RNG->SAMPLE_CNT = NRF_FICR->TRNG90B.ROSC1;
} while ( NRF_CC_RNG->SAMPLE_CNT != NRF_FICR->TRNG90B.ROSC1 );

/* Configure ROSC length */
NRF_CC_RNG->TRNG_CONFIG = CC_RNG_TRNG_CONFIG_ROSC_LEN_ROSC1;

/* Enable noise source */
NRF_CC_RNG->NOISE_SOURCE = CC_RNG_NOISE_SOURCE_ENABLE_Enabled;

/* Wait for random data to be sampled */
while ((NRF_CC_RNG->RNG_ISR & CC_RNG_RNG_ISR_EHR_VALID_INT_Msk) == 0) {}

/* 192 bits of random data now available in
   NRF_CC_RNG->EHR_DATA[0] to NRF_CC_RNG->EHR_DATA[5] */
```

#### 7.7.12.6.5 Registers

|---------------------|--------|----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RNG_ISR             | 0x104  |    | Interrupt status register. Each bit of this register holds the interrupt status of a single interrupt source. If corresponding RNG_IMR bit is unmasked, an interrupt is generated.                         |
| RNG_ICR             | 0x108  |    | Interrupt clear register. Writing a 1 bit into a field in this register will clear the corresponding bit in RNG_ISR.                                                                                       |
| TRNG_CONFIG         | 0x10C  |    | TRNG ring oscillator length configuration                                                                                                                                                                  |
| TRNG_VALID          | 0x110  |    | This register indicates if TRNG entropy collection is valid.                                                                                                                                               |
| EHR_DATA[n]         | 0x114  |    | The entropy holding registers (EHR) hold 192-bits random data collected by the TRNG.<br><br>The initial EHR_DATA[0] register holds the least significant bits [31:0] of the random data value.             |
| NOISE_SOURCE        | 0x12C  |    | This register controls the ring oscillator circuit used as a noise source.                                                                                                                                 |
| SAMPLE_CNT          | 0x130  |    | Sample count defining the number of CPU clock cycles between two consecutive noise source samples.                                                                                                         |
| AUTOCORR_STATISTIC  | 0x134  |    | Statistics counter for autocorrelation test activations. Statistics collection is stopped if one of the counters reach its limit of all ones.                                                              |
| TRNG_DEBUG          | 0x138  |    | Debug register for the TRNG. This register is used to bypass TRNG tests in hardware.                                                                                                                       |
| RNG_SW_RESET        | 0x140  |    | Reset the RNG engine.                                                                                                                                                                                      |
| RNG_BUSY            | 0x1B8  |    | Status register for RNG engine activity.                                                                                                                                                                   |
| TRNG_RESET          | 0x1BC  |    | Reset the TRNG, including internal counter of collected bits and registers EHR_DATA and TRNG_VALID.                                                                                                        |
| RNG_HW_FLAGS        | 0x1C0  |    | Hardware configuration of RNG engine. Reset value holds the supported features.                                                                                                                            |
| RNG_CLK             | 0x1C4  |    | Control clock for the RNG engine.                                                                                                                                                                          |
| RNG_DMA             | 0x1C8  |    | Writing to this register enables the RNG DMA engine.                                                                                                                                                       |
| RNG_DMA_ROSC_LEN    | 0x1CC  |    | This register defines which ring oscillator length configuration should be used when using the RNG DMA engine.                                                                                             |
| RNG_DMA_SRAM_ADDR   | 0x1D0  |    | This register defines the start address in TRNG SRAM for the TRNG data to be collected by the RNG DMA engine.                                                                                              |
| RNG_DMA_SAMPLES_NUM | 0x1D4  |    | This register defines the number of 192-bits samples that the RNG DMA engine collects per run.                                                                                                             |
| RNG_WATCHDOG_VAL    | 0x1D8  |    | This register defines the maximum number of CPU clock cycles per TRNG collection of 192-bits samples. If the number of cycles for a collection exceeds this threshold the WATCHDOG interrupt is triggered. |
| RNG_DMA_BUSY        | 0x1DC  |    | Status register for RNG DMA engine activity.                                                                                                                                                               |

#### 7.7.12.6.5.1 RNG IMR

Address offset: 0x100

Interrupt mask register. Each bit of this register holds the mask of a single interrupt source.

|                  |     |                   |            |             |       |                                                                   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |

### 7.7.12.6.5.2 RNG\_ISR

Address offset: 0x104

Interrupt status register. Each bit of this register holds the interrupt status of a single interrupt source. If corresponding RNG\_IMR bit is unmasked, an interrupt is generated.

**7.7.12.6.5.5 TRNG\_VALID**

Address offset: 0x110

This register indicates if TRNG entropy collection is valid.

**7.7.12.6.5.6 EHR\_DATA[n] (n=0..5)**

Address offset: 0x114 + (n × 0x4)

The entropy holding registers (EHR) hold 192-bits random data collected by the TRNG.

The initial EHR\_DATA[0] register holds the least significant bits [31:0] of the random data value.

These registers are readable if register [TRNG\\_VALID](#) on page 244 is `Valid`. Reading register EHR\_DATA[5] will clear the content, reset TRNG\_VALID, and start a new 192 bits collection period.

#### 7.7.12.6.5.8 SAMPLE\_CNT

Address offset: 0x130

Sample count defining the number of CPU clock cycles between two consecutive noise source samples.

After selecting the desired ring oscillator length configuration in [TRNG\\_CONFIG](#) on page 244 this register must be set to the corresponding value from [FICR.TRNG90B.ROSC1-4](#).

#### 7.7.12.6.5.9 AUTOCORR\_STATISTIC

Address offset: 0x134

Statistics counter for autocorrelation test activations. Statistics collection is stopped if one of the counters reach its limit of all ones.

#### 7.7.12.6.5.20 RNG\_WATCHDOG\_VAL

Address offset: 0x1D8

This register defines the maximum number of CPU clock cycles per TRNG collection of 192-bits samples. If the number of cycles for a collection exceeds this threshold the WATCHDOG interrupt is triggered.

## 7.7.13 Host integration

This chapter describes host registers used to control CRYPTOCELL behavior.

### 7.7.13.1 AHB interface

The AHB interface controls CRYPTOCELL bus master behavior.

### 7.7.13.1.1 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description              |
|----------|-------------|--------------|-----------|-----|-----|--------------|--------------------------|
|          |             |              | Map       | Att | DMA |              |                          |
| CC_AHB   | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL AHB interface |

#### Register overview

| Register       | Offset | TZ | Description                                                                            |
|----------------|--------|----|----------------------------------------------------------------------------------------|
| AHBM_SINGLES   | 0xB00  |    | This register forces the AHB transactions from CRYPTOCELL master to be always singles. |
| AHBM_HPROT     | 0xB04  |    | This register holds the AHB HPROT value                                                |
| AHBM_HMASTLOCK | 0xB08  |    | This register holds AHB HMASTLOCK value                                                |
| AHBM_HNONSEC   | 0xB0C  |    | This register holds AHB HNONSEC value                                                  |

##### 7.7.13.1.1.1 AHBM\_SINGLES

Address offset: 0xB00

This register forces the AHB transactions from CRYPTOCELL master to be always singles.

|                  |                                                                                       |              |          |       |                   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |

## 7.7.13.2 AO interface

The always-on (AO) interface controls various persistent security configurations for the CRYPTOCELL subsystem.

### 7.7.13.2.1 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description         |
|----------|-------------|--------------|-----------|-----|-----|--------------|---------------------|
|          |             |              | Map       | Att | DMA |              |                     |
| CC_AO    | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL AO block |

#### Register overview

| Register         | Offset | TZ | Description                                             |
|------------------|--------|----|---------------------------------------------------------|
| AO_APB_FILTERING | 0xE38  |    | This register holds the AO_APB_FILTERING configuration. |
| CC_SW_RESET      | 0xE40  |    | Reset the CRYPTOCELL subsystem.                         |

### 7.7.13.2.1.1 AO\_APB\_FILTERING

Address offset: 0xE38

This register holds the AO\_APB\_FILTERING configuration.

|                  |     |                               |          |                                                                                       |  |                                                                                                                     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 7.7.13.3 CTL interface

The CTL interface controls the cryptographic flow and provide busy status for individual components in the CRYPTOCELL subsystem.

#### 7.7.13.3.1 Registers

##### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description              |
|----------|-------------|--------------|-----------|-----|-----|--------------|--------------------------|
|          |             |              | Map       | Att | DMA |              |                          |
| CC_CTL   | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL CTL interface |

##### Register overview

| Register    | Offset | TZ | Description                                              |
|-------------|--------|----|----------------------------------------------------------|
| CRYPTO_CTL  | 0x900  |    | Defines the cryptographic flow.                          |
| CRYPTO_BUSY | 0x910  |    | Status register for cryptographic cores engine activity. |
| HASH_BUSY   | 0x91C  |    | Status register for HASH engine activity.                |
| CONTEXT_ID  | 0x930  |    | A general-purpose read/write register.                   |

#### 7.7.13.3.1.1 CRYPTO\_CTL

Address offset: 0x900

Defines the cryptographic flow.

### 7.7.13.3.1.2 CRYPTO\_BUSY

Address offset: 0x910

Status register for cryptographic cores engine activity.

This register will be asserted whenever register [AES\\_BUSY](#) on page 208 or register [HASH\\_BUSY](#) on page 253 is asserted or when register [DIN\\_FIFO\\_EMPTY](#) on page 257 indicate that the DIN FIFO is not empty.

## 7.7.13.4 DIN DMA engine

The Data IN (DIN) DMA engine transfers data into the CRYPTOCELL subsystem and its various cryptographic engines.

The DIN DMA engine provides a comprehensive interface for to facilitate the transfer of data from the CPU or memory to the cryptographic engines. It includes a variety of registers that control direct data buffering, DMA operations, and data flow management.

Maximum DMA transaction size is limited to  $2^{16}-1$  bytes. If a DMA transaction is configured with a payload size above the maximum DMA transaction size limit, the DMA engine must be reset before being functional again using register [DIN\\_SW\\_RESET](#) on page 256.

The flow demonstrated in [Cryptographic flow](#) on page 205 shows how the DIN DMA engine is configured to provide data to the AES engine using registers [SRC\\_MEM\\_ADDR](#) on page 255 and

[SRC\\_MEM\\_SIZE](#) on page 255 to define the input source address and number of input bytes, respectively.

### 7.7.13.4.1 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description               |
|----------|-------------|--------------|-----------|-----|-----|--------------|---------------------------|
|          |             |              | Map       | Att | DMA |              |                           |
| CC_DIN   | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL DIN DMA engine |

#### Register overview

| Register                               | Offset | TZ | Description                                                                                                                                                  |
|----------------------------------------|--------|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DIN_BUFFER</a>             | 0xC00  |    | Used by CPU to write data directly to the DIN buffer, which is then sent to the cryptographic engines for processing.                                        |
| <a href="#">DIN_DMA_MEM_BUSY</a>       | 0xC20  |    | Status register for DIN DMA engine activity when accessing memory.                                                                                           |
| <a href="#">SRC_MEM_ADDR</a>           | 0xC28  |    | Data source address in memory.                                                                                                                               |
| <a href="#">SRC_MEM_SIZE</a>           | 0xC2C  |    | The number of bytes to be read from memory. Writing to this register triggers the DMA operation.                                                             |
| <a href="#">SRC_SRAM_ADDR</a>          | 0xC30  |    | Data source address in RNG SRAM.                                                                                                                             |
| <a href="#">SRC_SRAM_SIZE</a>          | 0xC34  |    | The number of bytes to be read from RNG SRAM. Writing to this register triggers the DMA operation.                                                           |
| <a href="#">DIN_DMA_SRAM_BUSY</a>      | 0xC38  |    | Status register for DIN DMA engine activity when accessing RNG SRAM.                                                                                         |
| <a href="#">DIN_DMA_SRAM_ENDIANNES</a> | 0xC3C  |    | Configure the endianness of DIN DMA transactions towards RNG SRAM.                                                                                           |
| <a href="#">DIN_SW_RESET</a>           | 0xC44  |    | Reset the DIN DMA engine.                                                                                                                                    |
| <a href="#">DIN_CPU_DATA</a>           | 0xC48  |    | Specifies the number of bytes the CPU will write to the DIN_BUFFER, ensuring the cryptographic engine processes the correct amount of data.                  |
| <a href="#">DIN_WRITE_ALIGN</a>        | 0xC4C  |    | Indicates that the next CPU write to the DIN_BUFFER is the last in the sequence. This is needed only when the data size is NOT modulo 4 (e.g. HASH padding). |
| <a href="#">DIN_FIFO_EMPTY</a>         | 0xC50  |    | Register indicating if DIN FIFO is empty and if more data can be accepted.                                                                                   |
| <a href="#">DIN_FIFO_RESET</a>         | 0xC58  |    | Reset the DIN FIFO, effectively clearing the FIFO for new data.                                                                                              |

##### 7.7.13.4.1.1 DIN\_BUFFER

Address offset: 0xC00

Used by CPU to write data directly to the DIN buffer, which is then sent to the cryptographic engines for processing.

The number of bytes to write is defined in [DIN\\_CPU\\_DATA](#) on page 256.

|            |  |  |  | #### 7.7.13.4.1.10 DIN\_CPU\_DATA

Address offset: 0xC48

Specifies the number of bytes the CPU will write to the DIN\_BUFFER, ensuring the cryptographic engine processes the correct amount of data.

|                  |     |       |          |                                                                                       |  |  |  |                                                                                                                    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

#### 7.7.13.4.1.11 DIN\_WRITE\_ALIGN

Address offset: 0xC4C

Indicates that the next CPU write to the DIN\_BUFFER is the last in the sequence. This is needed only when the data size is NOT modulo 4 (e.g. HASH padding).

### 7.7.13.5 DOUT DMA engine

The Data OUT (DOUT) DMA engine transfers data from the CRYPTOCELL subsystem and its various cryptographic engines.

The DOUT DMA engine provides a comprehensive interface for to facilitate the transfer of data to the CPU or memory from the cryptographic engines. It includes a variety of registers that control direct data buffering, DMA operations, and data flow management.

Maximum DMA transaction size is limited to  $2^{16}-1$  bytes. If a DMA transaction is configured with a payload size above the maximum DMA transaction size limit, the DMA engine must be reset before being functional again using register [DOUT\\_SW\\_RESET](#) on page 261.

The flow demonstrated in [Cryptographic flow](#) on page 205 shows how the DOUT DMA engine is configured to output data from the AES engine using registers [DST\\_MEM\\_ADDR](#) on page 259 and [DST\\_MEM\\_SIZE](#) on page 259 to define the output source address and number of output bytes, respectively.

### 7.7.13.5.1 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description                |
|----------|-------------|--------------|-----------|-----|-----|--------------|----------------------------|
|          |             |              | Map       | Att | DMA |              |                            |
| CC_DOUT  | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL DOUT DMA engine |

#### Register overview

| Register                                 | Offset | TZ | Description                                                                                                                                                     |
