 #### 7.7.13.5.1.9 DOUT\_READ\_ALIGN

Address offset: 0xD44

Indication that the next CPU read from the DOUT\_BUFFER is the last in the sequence. This is needed only when the data size is NOT modulo 4 (e.g. HASH padding).

|                  |     |       |          |                                                                         |    |    |    |                                                                                                             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

### 7.7.13.6 HOST register interface

The HOST\_RGF interface contains registers for CRYPTOCELL interrupt handling, in addition to power and clock configuration.

#### 7.7.13.6.1 Registers

#### Instances

| Instance    | Domain      | Base address | TrustZone |     |     | Split access | Description                        |
|-------------|-------------|--------------|-----------|-----|-----|--------------|------------------------------------|
|             |             |              | Map       | Att | DMA |              |                                    |

#### Register overview

| Register        | Offset | TZ | Description                                                                                                                                                                     |
|-----------------|--------|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IRR             | 0xA00  |    | Interrupt request register. Each bit of this register holds the interrupt status of a single interrupt source. If corresponding IMR bit is unmasked, an interrupt is generated. |
| IMR             | 0xA04  |    | Interrupt mask register. Each bit of this register holds the mask of a single interrupt source.                                                                                 |
| ICR             | 0xA08  |    | Interrupt clear register. Writing a 1 bit into a field in this register will clear the corresponding bit in IRR.                                                                |
| ENDIANNESS      | 0xA0C  |    | This register defines the endianness of the Host-accessible registers, and can only be written once.                                                                            |
| HOST_SIGNATURE  | 0xA24  |    | This register holds the CRYPTOCELL subsystem signature. See reset value.                                                                                                        |
| HOST_BOOT       | 0xA28  |    | Hardware configuration of the CRYPTOCELL subsystem. Reset value holds the supported features.                                                                                   |
| HOST_CC_IS_IDLE | 0xA7C  |    | Idle state register for the CRYPTOCELL subsystem.                                                                                                                               |
| HOST_POWERDOWN  | 0xA80  |    | This register start the power-down sequence.                                                                                                                                    |

#### 7.7.13.6.1.1 IRR

Address offset: 0xA00

Interrupt request register. Each bit of this register holds the interrupt status of a single interrupt source. If corresponding IMR bit is unmasked, an interrupt is generated.

| Bit number       |     |                  |          | 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |                                                                                                                                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 7.7.13.6.1.2 IMR

Address offset: 0xA04

Interrupt mask register. Each bit of this register holds the mask of a single interrupt source.

| Bit number       |     |                   |            | 31                                                                          | 30                                                                          | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

#### 7.7.13.6.1.4 ENDIANNESS

Address offset: 0xA0C

This register defines the endianness of the Host-accessible registers, and can only be written once.

### 7.7.13.6.1.7 HOST\_CC\_IS\_IDLE

Address offset: 0xA7C

Idle state register for the CRYPTOCELL subsystem.

Other fields in this register will indicate which parts of CRYPTOCELL subsystem are busy.

**7.7.13.8 MISC interface**

The MISC interface controls clocks for the individual engines within the CRYPTOCELL subsystem.

Each cryptographic engine has an individual register for performing clock gating. Engine clock status is displayed in register [CLK\\_STATUS](#) on page 268.Clock control for the [GHASH engine](#) on page 218 is handled by enabling clock for the HASH engine, and then selecting GHASH engine in register [HASH\\_SELECT](#) on page 223.

**Note:** Clock control for the [RNG engine](#) on page 238 is handled by register [RNG\\_CLK](#) on page 247 and not through the MISC interface.

## 7.7.13.8.1 Registers

### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description               |
|----------|-------------|--------------|-----------|-----|-----|--------------|---------------------------|
|          |             |              | Map       | Att | DMA |              |                           |
| CC_MISC  | APPLICATION | 0x50845000   | HF        | S   | NSA | No           | CRYPTOCELL MISC interface |

### Register overview

| Register   | Offset | TZ | Description                          |
|------------|--------|----|--------------------------------------|
| AES_CLK    | 0x810  |    | Clock control for the AES engine.    |
| HASH_CLK   | 0x818  |    | Clock control for the HASH engine.   |
| PKA_CLK    | 0x81C  |    | Clock control for the PKA engine.    |
| DMA_CLK    | 0x820  |    | Clock control for the DMA engines.   |
| CLK_STATUS | 0x824  |    | CRYPTOCELL clocks status register.   |
| CHACHA_CLK | 0x858  |    | Clock control for the CHACHA engine. |

#### 7.7.13.8.1.1 AES\_CLK

Address offset: 0x810

Clock control for the AES engine.

## 7.8 DCNF — Domain configuration

The domain configuration (DCNF) peripheral enables identification of the CPU by its CPU ID in the device (CUID). It also provides protection of the AHB multilayer interconnect (AMLI).

AMLI protection is enabled through the DCNF configuration registers that can block some paths from the AHB masters to their respective AHB slaves in the AMLI.

For an illustration of how the AHB masters and slaves are connected through the AMLI, see [Memory](#) on page 21.

### 7.8.1 Protection

DCNF protection blocks the path of AHB masters in an external core from accessing AHB slaves in the AMLI of the local core. Essentially, blocking external core access to internal resources of the local core.

The following figure is a simplified version of the AMLI that shows the set of configuration registers used to control this behavior. A more detailed AMLI figure can be found in [Memory](#) on page 21.

Figure 60: Domain configuration

The DCNF configuration registers that enable the DCNF protection are the following:

- [EXTPERI\[n\].PROTECT](#)
- [EXTRAM\[n\].PROTECT](#)
- [EXTCODE\[n\].PROTECT](#)

An attempt to access the blocked resources will trigger a BusFault or a HardFault exception, depending on the value of the BUSFAULTENA bit in the Arm Cortex-M33 SHCSR (system handler control and state register). This is described in the *Arm Cortex-M33 Devices Generic User Guide*.

## RAM protection

RAM regions are protected by configuring the SLAVE bits in the register [EXTRAM\[n\].PROTECT](#) of the equivalent master port.

## Peripheral protection

Peripheral memory regions are protected by configuring the SLAVE bits in the register [EXTPERI\[n\].PROTECT](#) of the equivalent master port.

## Code protection

Code memory regions are protected by configuring the SLAVE bits in the register [EXTCODE\[0\].PROTECT](#) of the equivalent master port.

## 7.8.2 Registers

### Instances

| Instance  | Domain      | Base address | TrustZone |     |     | Split access | Description          |
|-----------|-------------|--------------|-----------|-----|-----|--------------|----------------------|
|           |             |              | Map       | Att | DMA |              |                      |
| DCNF : S  | APPLICATION | 0x50000000   | US        | S   | NA  | No           | Domain configuration |
| DCNF : NS |             | 0x40000000   |           |     |     |              |                      |
| DCNF      | NETWORK     | 0x41000000   | HF        | NS  | NA  | No           | Domain configuration |

### Configuration

| Instance  | Domain      | Configuration                                                                                                                                                                              |
|-----------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| DCNF      | NETWORK     | Registers <a href="#">EXTPERI[n].PROTECT</a> , <a href="#">EXTRAM[n].PROTECT</a> , and <a href="#">EXTCODE[n].PROTECT</a> not available for the network core.<br>CPUID value is 0x00000001 |

### Register overview

| Register                           | Offset | TZ | Description                                                                         |
|------------------------------------|--------|----|-------------------------------------------------------------------------------------|
| CPUID                              | 0x420  |    | CPU ID of this subsystem                                                            |
| <a href="#">EXTPERI[n].PROTECT</a> | 0x440  |    | Control access for master connected to AMLI master port <a href="#">EXTPERI[n]</a>  |
| <a href="#">EXTRAM[n].PROTECT</a>  | 0x460  |    | Control access from master connected to AMLI master port <a href="#">EXTRAM[n]</a>  |
| <a href="#">EXTCODE[n].PROTECT</a> | 0x480  |    | Control access from master connected to AMLI master port <a href="#">EXTCODE[n]</a> |

### 7.8.2.1 CPUID

Address offset: 0x420

CPU ID of this subsystem

|            |  |  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 7.9 DPPI — Distributed programmable peripheral interconnect

The distributed programmable peripheral interconnect (DPPI) enables peripherals to interact autonomously with each other by using tasks and events, without any intervention from the CPU. DPPI allows precise synchronization between peripherals when real-time application constraints exist, and eliminates the need for CPU involvement to implement behavior which can be predefined using the DPPI.

**Note:** For more information on tasks, events, publish/subscribe, interrupts, and other concepts, see [Peripheral interface](#) on page 149.

The DPPI has the following features:

- Peripheral tasks can subscribe to channels
- Peripheral events can be published on channels
- Publish/subscribe pattern enabling multiple connection options that include the following:
  - One-to-one
  - One-to-many
  - Many-to-one
  - Many-to-many

The DPPI consists of several PPIBus modules, which are connected to a fixed number of DPPI channels and a DPPI controller (DPPIC).

Figure 61: DPPI overview

### 7.9.1 Subscribing to and publishing on channels

The PPIBus can route peripheral events onto the channels (publishing), or route events from the channels into peripheral tasks (subscribing).

All peripherals include the following:

- One subscribe register per task
- One publish register per event

Publish and subscribe registers use a channel index field to determine the channel to which the event is published or tasks subscribed. In addition, there is an enable bit for the subscribe and publish registers that needs to be enabled before the subscription or publishing takes effect.

Writing non-existing channel index (CHIDX) numbers into a peripheral's publish or subscribe registers will yield unexpected results.

One event can trigger multiple tasks by subscribing different tasks to the same channel. Similarly, one task can be triggered by multiple events by publishing different events to the same channel. For advanced use cases, multiple events and multiple tasks can connect to the same channel forming a many-to-many connection. If multiple events are published on the same channel at the same time, the events are merged and only one event is routed through the DPPI.

How peripheral events are routed onto different channels based on publish registers is illustrated in the following figure.

Figure 62: DPPI events flow

The following figure illustrates how peripheral tasks are triggered from different channels based on subscribe registers.

Figure 63: DPPI tasks flow

### 7.9.2 DPPI controller (DPPIC)

Enabling and disabling of channels globally is handled through DPPIC. Connection (connect/disconnect) between a channel and a peripheral is handled locally by the PPIBus.

There are two ways of enabling and disabling global channels using DPPIC:

- Enable or disable channels individually using registers CHEN, CHENSET, and CHENCLR.
- Enable or disable channels in channel groups using the groups' tasks ENABLE and DISABLE. It needs to be defined which channels belong to which channel groups before these tasks are triggered.

**Note:** ENABLE tasks are prioritized over DISABLE tasks. When a channel belongs to two or more groups, for example group m and n, and the tasks CHG[m].EN and CHG[n].DIS occur simultaneously (m and n can be equal or different), the CHG[m].EN task on that channel is prioritized.

DPPIC tasks (for example CHG[0].EN) can be triggered through DPPI like any other task, which means they can be linked to a DPPI channel through the subscribe registers.

In order to write to CHG[x], the corresponding CHG[x].EN and CHG[x].DIS subscribe registers must be disabled. Writes to CHG[x] are ignored if any of the two subscribe registers are enabled.

### 7.9.3 Connection examples

DPPI offers several connection options. Examples are given for how to create one-to-one and many-to-many connections.

## One-to-one connection

This example shows how to create a one-to-one connection between TIMER compare register and SAADC start task.

The channel configuration is set up first. TIMER0 will publish its COMPARE0 event on channel 0, and SAADC will subscribe its START task to events on the same channel. After that, the channel is enabled through the DPPIC.

```
NRF_TIMER0->PUBLISH_COMPARE0 = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_SAADC->SUBSCRIBE_START    = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);

NRF_DPPIC->CHENSET = (DPPI_CHENSET_CH0_Set << DPPI_CHENSET_CH0_Pos);
```

## Many-to-many connection

The example shows how to create a many-to-many connection, showcasing the DPPIC's channel group functionality.

A channel group that includes only channel 0 is set up first. Then the GPIOTE and TIMER0 configure their IN0 and COMPARE0 events respectively to be published on channel 0, while the SAADC configures its START task to subscribe to events on channel 0. Through DPPIC, the CHG0 DISABLE task is configured to subscribe to events on channel 0. After an event is received on channel 0 it will be disabled. Finally, channel 0 is enabled using the DPPIC task to enable a channel group.

```
NRF_DPPIC->CHG[0] = (DPPI_CHG_CH0_Included << PPI_CHG_CH0_Pos);

NRF_GPIOTE->PUBLISH_IN0      = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_TIMER0->PUBLISH_COMPARE0 = (DPPI_PUB_CHIDX_Ch0) |
                                (DPPI_PUB_EN_Msk);
NRF_SAADC->SUBSCRIBE_START    = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);
NRF_DPPIC->SUBSCRIBE_CHG[0].DIS = (DPPI_SUB_CHIDX_Ch0) |
                                (DPPI_SUB_EN_Msk);

NRF_DPPIC->TASK_CHG[0].EN = 1;
```

## 7.9.4 Special considerations for a system implementing TrustZone for Cortex-M processors

DPPI is implemented with split security, meaning it handles both secure and non-secure accesses. In a system implementing the TrustZone for Cortex-M technology, DPPI channels can be defined as secure or non-secure using the SPU.

A peripheral configured as non-secure will only be able to subscribe to or publish on non-secure DPPI channels. A peripheral configured as secure will be able to access all DPPI channels. DPPI handles both secure and non-secure accesses, but behaves differently depending on the access type:

- A non-secure peripheral access can only configure and control the DPPI channels defined as non-secure in the SPU.DPPI.PERM[] register(s)

- A secure peripheral access can control all the DPPI channels, independently of the SPU.DPPI.PERM[] register(s)

A group of channels can be created, making it possible to simultaneously enable or disable all channels within the group. The security attribute of a group of channels (secure or non-secure) is defined as follows:

- If all channels (enabled or not) within a group are non-secure, then the group is considered non-secure
- If at least one of the channels (enabled or not) within the group is secure, then the group is considered secure

A non-secure access to a DPPI register, or a bit field, controlling a channel marked as secure in SPU.DPPI[].PERM register(s) will be ignored. Write accesses will have no effect, and read accesses will always return a zero value.

No exceptions are triggered when non-secure accesses target a register or a bit field controlling a secure channel. For example, if the bit  $i$  is set in the SPU.DPPI[0].PERM register (declaring DPPI channel  $i$  as secure), then:

- Non-secure write accesses to registers CHEN, CHENSET, and CHENCLR cannot write bit  $i$  of these registers
- Non-secure write accesses to TASK\_CHG[j].EN and TASK\_CHG[j].DIS registers are ignored if the channel group  $j$  contains at least one channel defined as secure (it can be the channel  $i$  itself or any channel declared as secure)
- Non-secure read accesses to registers CHEN, CHENSET, and CHENCLR always read 0 for the bit at position  $i$

For the channel configuration registers (CHG[]), access from non-secure code is only possible if the included channels are all non-secure, whether the channels are enabled or not. If a CHG[g] register included one or more secure channel(s), then the group  $g$  is considered as secure, and only secure transfers can read to or write from CHG[g]. A non-secure write access is ignored, and a non-secure read access returns 0.

The DPPI can subscribe to secure and non-secure channels through the SUBSCRIBE\_CHG[] registers, in order to trigger the task for enabling or disabling groups of channels. An event from a secure channel will be ignored if the group subscribing to this channel is non-secure. A secure group can subscribe to a non-secure channel or a secure channel.

## 7.9.5 Registers

### Instances

| Instance   | Domain      | Base address | TrustZone |     |     | Split access | Description     |

## 7.10 ECB — AES electronic codebook mode encryption

The AES electronic codebook mode encryption (ECB) can be used for a range of cryptographic functions like hash generation, digital signatures, and keystream generation for data encryption/decryption. The ECB encryption block supports 128 bit AES encryption (encryption only, not decryption).

AES ECB operates with EasyDMA access to system Data RAM for in-place operations on cleartext and ciphertext during encryption. ECB uses the same AES core as the CCM and AAR blocks and is an asynchronous operation which may not complete if the AES core is busy.

AES ECB features:

- 128 bit AES encryption
- Supports standard AES ECB block encryption
- Memory pointer support
- DMA data transfer

AES ECB performs a 128 bit AES block encrypt. At the STARTECB task, data and key is loaded into the algorithm by EasyDMA. When output data has been written back to memory, the ENDECB event is triggered.

AES ECB can be stopped by triggering the STOPECB task.

### 7.10.1 Shared resources

The ECB, CCM, and AAR share the same AES module. The ECB will always have lowest priority and if there is a sharing conflict during encryption, the ECB operation will be aborted and an ERRORECB event will be generated.

### 7.10.2 EasyDMA

The ECB implements an EasyDMA mechanism for reading and writing to the Data RAM. This DMA cannot access the program memory or any other parts of the memory area except RAM.

If the ECBDATAPTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions.

The EasyDMA will have finished accessing the Data RAM when the ENDECB or ERRORECB is generated.

### 7.10.3 ECB data structure

Input to the block encrypt and output from the block encrypt are stored in the same data structure. ECBDATAPTR should point to this data structure before STARTECB is initiated.

| Property   | Address offset | Description                         |
|------------|----------------|-------------------------------------|
| KEY        | 0              | 16 byte AES key                     |
| CLEARTEXT  | 16             | 16 byte AES cleartext input block   |
| CIPHERTEXT | 32             | 16 byte AES ciphertext output block |

Table 31: ECB data structure overview

### 7.10.4.1 TASKS\_STARTECB

Address offset: 0x000

Start ECB block encrypt

If a crypto operation is already running in the AES core, the STARTECB task will not start a new encryption and an ERRORECB event will be triggered

## 7.10.5 Electrical specification

### 7.10.5.1 ECB Electrical Specification

| Symbol    | Description                             | Min. | Typ. | Max. | Units   |
|-----------|-----------------------------------------|------|------|------|---------|
| $t_{ECB}$ | Run time per 16 byte block in all modes |      |      | 6.2  | $\mu s$ |

## 7.11 EGU — Event generator unit

Event generator unit (EGU) provides support for interlayer signaling. This means providing support for atomic triggering of both CPU execution and hardware tasks, from both firmware (by CPU) and hardware (by PPI). This feature can be used for triggering CPU execution at a lower priority execution from a higher priority execution, or to handle a peripheral's interrupt service routine (ISR) execution at a lower priority for some of its events. However, triggering any priority from any priority is possible.

Listed here are the main EGU features:

- Software-enabled interrupt triggering
- Separate interrupt vectors for every EGU instance
- Up to 16 separate event flags per interrupt for multiplexing

EGU implements a set of tasks which can individually be triggered to generate the corresponding event. For example, the corresponding event for TASKS\_TRIGGER[n] is EVENTS\_TRIGGERED[n].

## 7.11.1 Registers

### Instances

| Instance  | Domain      | Base address | TrustZone |     |     | Split access | Description            |

## 7.11.2 Electrical specification

## 7.11.2.1 EGU Electrical Specification

| Symbol               | Description                                                                   | Min. | Typ. | Max. | Units  |
|----------------------|-------------------------------------------------------------------------------|------|------|------|--------|
| t <sub>EGU,EVT</sub> | Latency between setting an EGU event flag and the system setting an interrupt |      | 1    |      | cycles |

## 7.12 FPU — Floating point unit (FPU) exceptions

The Arm Cortex-M33 has FPU signals that indicate mathematical errors that cause floating-point exceptions.

The FPU signals are routed to the following event registers:

- FPUIOC: INVALIDOPERATION
- FPUIDC: DENORMALINPUT
- FPUOFC: OVERFLOW
- FPUUFC: UNDERFLOW
- FPUDZC: DIVIDEBYZERO
- FPUIXC: INEXACT

To clear the FPU exception source, write a 0 to the Arm Cortex-M33 FPSCR (floating-point status control register), as described in the *Arm Cortex-M33 Devices Generic User Guide*.

## 7.12.1 Registers

### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description                           |
|----------|-------------|--------------|-----------|-----|-----|--------------|---------------------------------------|
|          |             |              | Map       | Att | DMA |              |                                       |
| FPU : S  | APPLICATION | 0x50000000   | US        | S   | NA  | No           | Floating Point unit interrupt control |
| FPU : NS |             | 0x40000000   |           |     |     |              |                                       |

### Register overview

| Register                | Offset | TZ | Description                                                                                        |
|-------------------------|--------|----|----------------------------------------------------------------------------------------------------|
| EVENTS_INVALIDOPERATION | 0x100  |    | An FPUIOC exception triggered by an invalid operation has occurred in the FPU                      |
| EVENTS_DIVIDEBYZERO     | 0x104  |    | An FPUDZC exception triggered by a floating-point divide-by-zero operation has occurred in the FPU |
| EVENTS_OVERFLOW         | 0x108  |    | An FPUOFC exception triggered by a floating-point overflow has occurred in the FPU                 |
| EVENTS_UNDERFLOW        | 0x10C  |    | An FPUUFC exception triggered by a floating-point underflow has occurred in the FPU                |
| EVENTS_INEXACT          | 0x110  |    | An FPUIXC exception triggered by an inexact floating-point operation has occurred in the FPU       |
| EVENTS_DENORMALINPUT    | 0x114  |    | An FPUIDC exception triggered by a denormal floating-point input has occurred in the FPU           |
| INTEN                   | 0x300  |    | Enable or disable interrupt                                                                        |

## 7.13 GPIO — General purpose input/output

The general purpose input/output pins (GPIOs) are grouped as one or more ports with each port having up to 32 GPIOs.

The number of ports and GPIOs per port may vary with product variant and package. Refer to [Registers](#) on page 298 and [Pin assignments](#) on page 851 for more information about the number of GPIOs that are supported.

GPIO has the following user-configurable features:

- Up to 32 GPIO pins per GPIO port
- Configurable output drive strength
- Internal pull-up and pull-down resistors
- Wake-up from high or low level triggers on all pins
- Trigger interrupt on state changes on any pin
- All pins can be used by the PPI task/event system
- One or more GPIO outputs can be controlled through PPI and GPIOTE channels
- All pins can be individually mapped to interface blocks for layout flexibility
- GPIO state changes captured on SENSE signal can be stored by LATCH register
- Pin sharing in multi-MCU system
- Support for secure and non-secure attributes for pins in conjunction with the system protection unit (SPU — [System protection unit](#) on page 651)

[GPIO port and the GPIO pin details](#) on page 293 illustrates the GPIO port containing 32 individual pins, where `PIN0` is illustrated in more detail as a reference. All signals on the left side in the illustration are used by other peripherals in the system and therefore not directly available to the CPU.

Figure 64: GPIO port and the GPIO pin details

### 7.13.1 Assigning pins between cores, peripherals, or subsystems

GPIO pins of the system can be allocated among the cores, peripherals with dedicated pins, or subsystems such as trace and debug.

The pins of the system are listed in [Pin assignments](#) on page 851.

A pin can be assigned to any of the following:

- Application core
- Network core
- Peripheral with dedicated pins
- Trace and debug (TaD) subsystem

By default, all pins are assigned to the application core. The application core's MCUSEL bitfield in register [PIN\\_CNFR\[n\] \(n=0..31\) \(Retained\)](#) on page 302 controls the allocation of the pins into cores, peripherals and the TaD subsystem.

The pin's state, being either an output, input, or analog, can only be controlled and observed by the core for which the pin was allocated. Reading a pin that is not allocated to the current core will return zero, and writes will be ignored. If a pin is allocated to a subsystem that cannot access it, the pin stays under control of the application core's GPIO peripheral.

The GPIO peripheral of any core has its own set of registers that can be read and written independently, but they only affect a pin when it has been allocated to this core. Reading the GPIO peripheral registers of one core does not reveal the register contents of a different core.

The following figure illustrates how to assign a pin to a core, to a peripheral that has dedicated pins, or a subsystem such as trace and debug.

Figure 65: Pin allocation in multiple-core system

**Note:** To avoid glitches, changing the MCUSEL bitfield for a pin should only occur when the pin is disabled.

Also note that when a pin  $p$  is not assigned to the application core, the application core's GPIO LATCH register, [PIN\\_CNFR\[p\].MCUSEL](#) bitfield, and [PIN\\_CNFR\[p\].SENSE](#) bitfield is prevented. For these, any write operations are ignored, and any read operation will return 0.

### 7.13.2 Pin configuration

The GPIO port peripheral implements up to 32 pins, [PIN0](#) through [PIN31](#). Each of these pins can be individually configured in the [PIN\\_CNFR\[n\]](#) registers ( $n=0..31$ ).

**Note:** For more information on pin assignment and the corresponding effect of read and write operations of GPIO registers, see [Assigning pins between cores, peripherals, or subsystems](#) on page 294.

The following parameters can be configured through these registers:

- Direction
- Drive strength
- Enabling of pull-up and pull-down resistors
- Pin sensing
- Input buffer disconnect
- Analog input (for selected pins)

**Note:** All write-capable registers are retained registers, see [POWER — Power control](#) on page 46 for more information.

The input buffer of a GPIO pin can be disconnected from the pin to enable power savings when the pin is not used as an input, see [GPIO port and the GPIO pin details](#) on page 293. Inputs must be connected to get a valid input value in the **IN** register, and for the sense mechanism to get access to the pin.

Other peripherals in the system can connect to GPIO pins and override their output value and configuration, or read their analog or digital input value. See [GPIO port and the GPIO pin details](#) on page 293.

Selected pins also support analog input signals, see **ANAIN** in [GPIO port and the GPIO pin details](#) on page 293. The assignment of the analog pins can be found in [Pin assignments](#) on page 851.

The drive strength is configured using the **DRIVE** field of register **PIN\_CNF[n] (n=0..31) (Retained)** on page 302. Some pins may not support every drive configuration, see [Pin assignments](#) on page 851 for more information.

The following delays should be taken into considerations:

- There is a delay of 2 CPU clock cycles from the GPIO pad to the **IN** register.
- The GPIO pad must be low (or high depending on the **SENSE** polarity) for 3 CPU clock cycles after **DETECT** has gone high to generate a new **DETECT** signal.

**Note:** When a pin is configured as digital input, care has been taken to minimize increased current consumption when the input voltage is between  $V_{IL}$  and  $V_{IH}$ . However, it is a good practice to ensure that the external circuitry does not drive that pin to levels between  $V_{IL}$  and  $V_{IH}$  for a long period of time.

### 7.13.3 Pin sense mechanism

Pins sensitivity can be individually configured, through the **SENSE** field in the **PIN\_CNF[n]** register, to detect either a high level or a low level on their input.

**Note:** Refer to [Assigning pins between cores, peripherals, or subsystems](#) on page 294 for pin assignment and corresponding effect of read and write operations of GPIO registers

When the correct level is detected on any such configured pin, the sense mechanism will set the **DETECT** signal high. Each pin has a separate **DETECT** signal. Default behavior, defined by the **DETECTMODE** register, is that the **DETECT** signals from all pins in the GPIO port are combined into one common **DETECT** signal that is routed throughout the system, which then can be utilized by other peripherals. This mechanism is functional in both System ON and System OFF modes.

DETECTMODE and DETECTMODE\_SEC are provided to handle secure and non-secure pins.

DETECTMODE\_SEC register is available to control the behavior associated to pin marked as secure, while the DETECTMODE register is restricted to pin marked as non-secure. Please refer to [GPIO security](#) on page 297 for more details.

Make sure that a pin is in a level that cannot trigger the sense mechanism before enabling it. The DETECT signal will go high immediately if the SENSE condition configured in the PIN\_CNF registers is met when the sense mechanism is enabled. This will trigger a PORT event if the DETECT signal was low before enabling the sense mechanism.

The DETECT signal is also used by power and clock management system to exit from System OFF mode, and by GPIOTE to generate the PORT event. In addition GPIOTE\_SEC is used for PORT event related to secure pins). See [POWER — Power control](#) on page 46 and [GPIOTE — GPIO tasks and events](#) on page 304 for more information about how the DETECT signal is used.

When a pin's PINx.DECTECT signal goes high, a flag will be set in the [LATCH](#) register. For example, when the PIN0.DECTECT signal goes high, bit 0 in the [LATCH](#) register will be set to '1'. If the CPU performs a clear operation on a bit in the [LATCH](#) register when the associated PINx.DECTECT signal is high, the bit in the [LATCH](#) register will not be cleared. The [LATCH](#) register will only be cleared if the CPU explicitly clears it by writing a '1' to the bit that shall be cleared, i.e. the [LATCH](#) register will not be affected by a PINx.DECTECT signal being set low.

The LDETECT signal will be set high when one or more bits in the [LATCH](#) register are '1'. The LDETECT signal will be set low when all bits in the [LATCH](#) register are successfully cleared to '0'.

If one or more bits in the [LATCH](#) register are '1' after the CPU has performed a clear operation on the [LATCH](#) registers, a rising edge will be generated on the LDETECT signal. This is illustrated in [DETECT signal behavior](#) on page 297.

**Note:** The CPU can read the [LATCH](#) register at any time to check if a SENSE condition has been met on one or more of the the GPIO pins, even if that condition is no longer met at the time the CPU queries the [LATCH](#) register. This mechanism will work even if the LDETECT signal is not used as the DETECT signal.

The LDETECT signal is by default not connected to the GPIO port's DETECT signal, but via the DETECTMODE register it is possible to change from default behavior to DETECT signal being derived directly from the LDETECT signal instead. See [GPIO port and the GPIO pin details](#) on page 293. [DETECT signal behavior](#) on page 297 illustrates the DETECT signal behavior for these two alternatives.

Figure 66: DETECT signal behavior

### 7.13.4 GPIO security

The general purpose input/output (GPIO) peripheral is implemented as a *split-security* peripheral. If marked as non-secure, it can be accessed by both secure and non-secure accesses but will behave differently depending on the access type.

**Note:** For more information on pin assignment and the corresponding effect of read and write operations of GPIO registers, see [Assigning pins between cores, peripherals, or subsystems](#) on page 294.

A non-secure peripheral access will only be able to configure and control pins defined as non-secure in the system protection unit (SPU) GPIOPORT.PERM[] register(s).

A non-secure access to a register or a bitfield controlling a pin marked as secure in GPIO.PERM[] register(s) will be ignored. Write access will have no effect and read access will return a zero value.

No exception is triggered when a non-secure access targets a register or bitfield controlling a secure pin. For example, if the bit *i* is set in the SPU.GPIO.PERM[0] register (declaring Pin P0.*i* as secure), then

- non-secure write accesses to OUT, OUTSET, OUTCLR, DIR, DIRSET, DIRCLR and LATCH registers will not be able to write to bit *i* of those registers
- non-secure write accesses to registers PIN[*i*].OUT and PIN\_CNF[*i*] will be ignored
- non-secure read accesses to registers OUT, OUTSET, OUTCLR, IN, DIR, DIRSET, DIRCLR and LATCH will always read a '0' for the bit at position *i*
- non-secure read accesses to registers PIN[*i*].OUT, PIN[*i*].OUT and PIN\_CNF[*i*] will always return 0

The GPIO.DETECTMODE and GPIO.DETECTMODE\_SEC registers are handled differently than the other registers mentioned before. When accessed by a secure access, the DETECTMODE\_SEC register control the source for the DETECT\_SEC signal for the pins marked as secure. When accessed by a non-secure access, the DETECTMODE\_SEC is read as zero and write accesses are ignored. The GPIO.DETECTMODE register controls the source for the DETECT\_NSEC signal for the pins defined as non-secure.

The DETECT\_NSEC signal is routed to the GPIOTE peripheral, allowing generation of events and interrupts from pins marked as non-secure. The DETECT\_SEC signal is routed to the GPIOTESEC peripheral, allowing generation of events and interrupts from pins marked as secure. [Principle of direct pin access](#) on page 298 illustrates how the DETECT\_NSEC and DETECT\_SEC signals are generated from the GPIO PIN[].DETECT signals.

Figure 67: Principle of direct pin access

## 7.14 GPIOTE — GPIO tasks and events

The GPIOTE tasks and events (GPIOTE) module provides functionality for accessing GPIO pins using tasks and events. Each GPIOTE channel can be assigned to one pin.

A GPIOTE block enables GPIOs to generate events on pin state change which can be used to carry out tasks through the PPI system. A GPIO can also be driven to change state on system events using the PPI system. Tasks and events are briefly introduced in [Peripheral interface](#) on page 149, and GPIO is described in more detail in [GPIO — General purpose input/output](#) on page 293.

Low power detection of pin state changes is possible when in System ON or System OFF.

Up to three tasks can be used in each GPIOTE channel for performing write operations to a pin. Two tasks are fixed (SET and CLR), and one (OUT) is configurable to perform following operations:

- Set
- Clear
- Toggle

An event can be generated in each GPIOTE channel from one of the following input conditions:

- Rising edge
- Falling edge
- Any change

### 7.14.1 Pin events and tasks

The GPIOTE module has a number of tasks and events that can be configured to operate on individual GPIO pins.

<sup>2</sup> Excludes the 20 mA dedicated high-speed open-drain pins used for TWI. VREGH specifications must be followed if operating in high voltage mode.

<sup>1</sup> Rise and fall times based on simulations

The secure instance of the GPIOTE peripheral is able to operate on all GPIO pins configured in [GPIOTE.CONFIG\[n\].PSEL](#).

The non-secure instance of the GPIOTE peripheral is able to operate only on non-secure GPIO pins. The field [GPIOTE.CONFIG\[n\].PSEL](#) can only select a non-secure pin.

The tasks SET[n], CLR[n], and OUT[n] can write to individual pins, and events IN[n] can be generated from input changes of individual pins.

The SET task will set the pin selected in [GPIOTE.CONFIG\[n\].PSEL](#) to high. The CLR task will set the pin low.

The effect of the OUT task on the pin is configurable in CONFIG[n].POLARITY. It can set the pin high, set it low, or toggle it.

Tasks and events are configured using the CONFIG[n] registers. One CONFIG[n] register is associated with a set of SET[n], CLR[n], and OUT[n] tasks and IN[n] events.

As long as a SET[n], CLR[n], and OUT[n] task or an IN[n] event is configured to control pin **n**, the pin's output value will only be updated by the GPIOTE module. The pin's output value, as specified in the GPIO, will be ignored as long as the pin is controlled by GPIOTE. Attempting to write to the pin as a normal GPIO pin will have no effect. When the GPIOTE is disconnected from a pin, the associated pin gets the output and configuration values specified in the GPIO module, see MODE field in CONFIG[n] register.

When conflicting tasks are triggered simultaneously (i.e. during the same clock cycle) in one channel, the priority of the tasks is as described in the following table.

| Priority | Task |
|----------|------|
| 1        | OUT  |
| 2        | CLR  |
| 3        | SET  |

Table 32: Task priorities

When setting the CONFIG[n] registers, MODE=Disabled does not have the same effect as MODE=Task and POLARITY=None. In the latter case, a CLR or SET task occurring at the exact same time as OUT will end up with no change on the pin, based on the priorities described in the table above.

When a GPIOTE channel is configured to operate on a pin as a task, the initial value of that pin is configured in the OUTINIT field of CONFIG[n].

### 7.14.2 Port event

PORT is an event that can be generated from multiple input pins using the GPIO DETECT signal.

The event will be generated on the rising edge of the DETECT signal. See [GPIO — General purpose input/output](#) on page 293 for more information about the DETECT signal.

There are two DETECT signals that come from the [GPIO](#) peripheral. The secure DETECT\_SEC, for the secure instance of the GPIOTE peripheral, and the non-secure DETECT\_NONSEC, for the non-secure instance of the GPIOTE peripheral.

The GPIO DETECT signal will not wake the system up again if the system is put into System ON IDLE while the DETECT signal is high. Clear all DETECT sources before entering sleep. If the LATCH register is used as a source, a new rising edge will be generated on DETECT if any bit in LATCH is still high after clearing all or part of the register. This could occur if one of the PINx.DETECT signals is still high, for example. See [Pin sense mechanism](#) on page 295 for more information.

Setting the system to System OFF while DETECT is high will cause a wakeup from System OFF reset.

This feature can be used to wake up the CPU from a WFI or WFE type sleep in System ON when all peripherals and the CPU are idle, meaning the lowest power consumption in System ON mode.

To prevent spurious interrupts from the PORT event while configuring the sources, the following steps must be performed:

1. Disable interrupts on the PORT event (through `INTENCLR.PORT`).
2. Configure the sources (`PIN_CNF[n].SENSE`).
3. Clear any potential event that could have occurred during configuration (write 0 to `EVENTS_PORT`).
4. Enable interrupts (through `INTENSET.PORT`).

### 7.14.3 Tasks and events pin configuration

Each GPIOTE channel is associated with one physical GPIO pin through the `CONFIG.PSEL` field.

When Event mode is selected in `CONFIG.MODE`, the pin specified by `CONFIG.PSEL` will be configured as an input, overriding the `DIR` setting in `GPIO`. Similarly, when Task mode is selected in `CONFIG.MODE`, the pin specified by `CONFIG.PSEL` will be configured as an output overriding the `DIR` setting and `OUT` value in `GPIO`. When Disabled is selected in `CONFIG.MODE`, the pin specified by `CONFIG.PSEL` will use its configuration from the `PIN[n].CNF` registers in `GPIO`.

**Note:** A pin can only be assigned to one GPIOTE channel at a time. Failing to do so may result in unpredictable behavior.

### 7.14.4 Low power

In Event mode (`CONFIG.MODE=Event`), the register `LATENCY` on page 310 makes it possible to reduce power consumption.

To enable the power saving behavior, set register `LATENCY` to `LowPower`.

`LowPower` can be used with both PORT event (`EVENTS_PORT`) and IN event (`EVENTS_IN`). The GPIO pins must have their `PIN_CNF[n].SENSE` configured.

When using `LowPower` with IN event, the GPIO `PIN_CNF[]` register's `SENSE` field needs to be configured according to `CONFIG.POLARITY` for the selected pin.

- When `CONFIG.POLARITY=LoToHi`, `SENSE` must be set to `High`.
- When `CONFIG.POLARITY=HiToLo`, `SENSE` must be set to `Low`.

When using `LowPower` with PORT event, the GPIO `PIN_CNF[]` register's `SENSE` field can have any value.

`CONFIG.POLARITY=Toggle` is not supported for `LATENCY=LowPower`.

### 7.14.5 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split<br>access | Description           |
|----------|-------------|--------------|-----------|-----|-----|-----------------|-----------------------|

### 7.14.5.13 LATENCY

Address offset: 0x504

Latency selection for Event mode (MODE=Event) with rising or falling edge detection on the pin.

POLARITY=Toggle can only be used with LATENCY=LowLatency.

## 7.15 I<sup>2</sup>S — Inter-IC sound interface

The I<sup>2</sup>S (Inter-IC Sound) module, supports the original two-channel I<sup>2</sup>S format, and left- or right-aligned formats. It implements EasyDMA for sample transfer directly to and from RAM without CPU intervention.

The I<sup>2</sup>S peripheral has the following main features:

- Master and Slave mode
- Simultaneous bidirectional (TX and RX) audio streaming
- Original I<sup>2</sup>S and left- or right-aligned format
- 32, 24, 16 and 8-bit sample widths
- Separate sample and word widths
- Low-jitter master clock generator
- Various sample rates

Figure 68: I<sup>2</sup>S master

### 7.15.1 Mode

The I<sup>2</sup>S protocol specification defines two modes of operation, Master and Slave.

The I<sup>2</sup>S mode decides which of the two sides (master or slave) shall provide the clock signals LRCK and SCK, and these signals are always supplied by the master to the slave.

### 7.15.2 Transmitting and receiving

The I<sup>2</sup>S module supports both transmission (TX) and reception (RX) of serial data. In both cases the serial data is shifted synchronously to the clock signals SCK and LRCK.

TX data is written to the SDOUT pin on the falling edge of SCK, and RX data is read from the SDIN pin on the rising edge of SCK. The most significant bit (MSB) is always transmitted first.

**Note:** When starting a transmission in master mode, the first frame is filled with zeros.

TX and RX are available in both Master and Slave modes and can be enabled/disabled independently in the [CONFIG.TXEN](#) on page 330 and [CONFIG.RXEN](#) on page 330.

Transmission and/or reception is started by triggering the [START](#) task. With transmission enabled in [CONFIG.TXEN](#), the [TXPTRUPD](#) event will be generated for every number of transmitted data words given by [RXTXD.MAXCNT](#) on page 334. Each data word contains one or more samples. The [TXPTRUPD](#) event is generated just before [MAXCNT](#) number of data words have been transmitted. Similarly, with reception enabled in [CONFIG.RXEN](#), the [RXPTRUPD](#) event will be generated for every received data word given by [RXTXD.MAXCNT](#) on page 334. The [RXPTRUPD](#) event is generated just after [MAXCNT](#) number of data words have been received.

The [FRAMESTART](#) event is generated synchronously to the active LRCK edge at the beginning of a frame after transmitting [RXTXD.MAXCNT](#) data words. The initial [FRAMESTART](#) event is generated at the first active edge of LRCK after the [START](#) task has been triggered. The [FRAMESTART](#) event is only defined for transmitting full left and right sample pairs. If [MAXCNT](#) is configured so that the frame ends between the left and right sample pairs, the [FRAMESTART](#) event is not generated. This occurs for the following combinations of [SWIDTH](#) and [MAXCNT](#):

| SWIDTH    | MAXCNT restriction               |
|-----------|----------------------------------|
| 24Bit     | Only even numbers (2,4,6, etc)   |
| 32        | Only even numbers (2, 4, 6, etc) |
| 24BitIn32 | Only even numbers (2, 4, 6, etc) |

Table 33: Restrictions on combinations of [SWIDTH](#) and [MAXCNT](#) for correct [FRAMESTART](#)

Figure 69: Transmitting and receiving. [CONFIG.FORMAT](#) = Aligned, [CONFIG.SWIDTH](#) = 8Bit, [CONFIG.CHANNELS](#) = Stereo, [RXTXD.MAXCNT](#) = 1

### 7.15.3 Left right clock (LRCK)

The left right clock (LRCK), often referred to as word clock, sample clock, or word select in I<sup>2</sup>S context, is the clock defining the frames in serial bitstreams sent and received on SDOUT and SDIN, respectively.

In I2S format, each frame contains one left and/or right sample pair. The left sample is transferred during the low half period of LRCK, followed by the right sample being transferred during the high half period of LRCK.

In Aligned format, each frame contains one left and/or right sample pair. The left sample is transferred during the high half period of LRCK, followed by the right sample being transferred during the low half period of LRCK.

For mono, the frame will contain only zeros for the unused half period of LRCK.

Consequently, the LRCK frequency is equivalent to the audio sample rate.

When operating in Master mode, the LRCK is generated from the MCK, and the frequency of LRCK is then given as:

$$\text{LRCK} = \text{MCK} / \text{CONFIG.RATIO}$$

LRCK always toggles around the falling edge of the serial clock SCK.

### 7.15.4 Serial clock (SCK)

The serial clock (SCK), often referred to as the serial bit clock, pulses once for each data bit being transferred on the serial data lines SDIN and SDOUT.

When operating in Master mode, the SCK is generated from the MCK, and the frequency of SCK is then given as:

$$\text{SCK} = 2 * \text{LRCK} * \text{CONFIG.SWIDTH}$$

The falling edge of the SCK falls on the toggling edge of LRCK.

When operating in Slave mode, SCK is provided by the external I<sup>2</sup>S master.

### 7.15.5 Master clock (MCK)

The master clock (MCK) is the clock from which LRCK and SCK are derived when operating in Master mode.

The master clock generator always needs to be enabled when in Master mode, but the generator can also be enabled when in Slave mode. Enabling the generator when in Slave mode can be useful in the case where the external master is not able to generate its own master clock.

MCK is generated from the clock source selected in the [CONFIG.CLKCONFIG](#) and [CONFIG.MCKFREQ](#) registers.

The following equation can be used to calculate the value of [CONFIG.MCKFREQ](#) for given MCK and clock source frequency:

$$\text{MCKFREQ} = 4096 \cdot \left\lceil \frac{f_{\text{MCK}} \cdot 1048576}{f_{\text{source}} + \frac{f_{\text{MCK}}}{2}} \right\rceil$$

Figure 70: MCK clock frequency equation

The parameter  $f_{\text{MCK}}$  is the requested MCK clock frequency in Hz, and  $f_{\text{source}}$  is the frequency of the selected clock source in Hz. Because of rounding errors, an accurate MCK clock may not be achievable. The equation does not take into account the maximum register value of [CONFIG.MCKFREQ](#) on page 331.

The actual MCK frequency can be calculated using the equation below.

$$f_{\text{actual}} = \frac{f_{\text{source}}}{\left\lceil \frac{1048576 \cdot 4096}{\text{MCKFREQ}} \right\rceil}$$

Figure 71: Actual MCK clock frequency

The clock error can be calculated using the equation below. The error  $e$  is the percentage difference from the requested  $f_{MCK}$  frequency.

$$e = 100 \cdot \frac{f_{actual} - f_{MCK}}{f_{MCK}} = 100 \cdot \frac{\left\lfloor \frac{f_{source}}{1048576 \cdot 4096} \right\rfloor \cdot f_{MCK} - f_{MCK}}{f_{MCK}}$$

Figure 72: MCK frequency error equation

The master clock generator does not add any jitter to the clock source chosen.

The master clock generator is enabled/disabled using `CONFIG.MCKEN` on page 330, and the generator is started or stopped by the `START` or `STOP` tasks respectively.

The MCK frequency can be adjusted on-the-fly:

- For PCLK32M, by using `MCKFREQ`
- For ACLK, by adjusting the audio clock source, see [CLOCK — Clock control](#) on page 72.

In Master mode, the LRCK and the SCK frequencies are closely related as both are derived from MCK and set indirectly through `CONFIG.RATIO` on page 332 and `CONFIG.SWIDTH` on page 332.

When configuring these registers, the user is responsible for fulfilling the following requirements:

1. The SCK frequency can never exceed the MCK frequency.
2. The MCK/LRCK ratio shall be a multiple of  $2 \cdot \text{CONFIG.SWIDTH}$ .

The MCK signal can be routed to an output pin (specified in `PSEL.MCK`) to supply external I<sup>2</sup>S devices that require the MCK to be supplied from the outside.

When operating in Slave mode, the I<sup>2</sup>S module does not use the MCK and the MCK generator does not need to be enabled.

Figure 73: Relation between `RATIO`, MCK and LRCK

### 7.15.5.1 Clock source selection

The clock source for the master clock generator can be selected in the register `CONFIG.CLKCONFIG` on page 333. Choose one of the following clocks as the clock source:

- 32 MHz peripheral clock (PCLK32M), synchronous to HFCLK.
- Audio PLL clock (ACLK) with configurable frequency.

To improve the master clock accuracy and jitter performance, it is recommended (but not mandatory) that the PCLK32M source is running off the HFXO instead of the HFINT oscillator. The ACLK source requires the use of HFXO. See [CLOCK — Clock control](#) on page 72 for more information about starting HFXO for the relevant clock source.

The master clock generator can be bypassed so the MCK clock is derived directly from the input source. This can be configured in the `BYPASS` field of register `CONFIG.CLKCONFIG` on page 333.

### 7.15.5.2 Configuration examples

Configuration examples for `CLKCONFIG = PCLK32M` on page 316 and [Configuration examples for CLKCONFIG = ACLK](#) on page 316 show some configuration examples for popular sample rates, using both the 32 MHz master clock and the Audio PLL clock source.

| Source frequency [Hz] | Requested LRCK [Hz] | RATIO | Requested MCK [Hz] | MCKFREQ   | MCK [Hz] | LRCK [Hz] | LRCK error [%] |
|-----------------------|---------------------|-------|--------------------|-----------|----------|-----------|----------------|
| 32000000              | 16000               | 32    | 512000             | 68173824  | 507936   | 15873     | -0.8           |

Table 35: Configuration examples for CLKCONFIG = ACLK

### 7.15.6 Width, alignment and format

The register `CONFIG.SWIDTH` on page 332 defines the sample width of the data read and written to memory, as well as the number of SCK clock cycles per half-frame. Figure [Aligned format, with CONFIG.SWIDTH configured to 16 bit samples in a 16 bit half-frame](#) on page 317 illustrates a configuration with identical sample and half-frame widths. The number of SCK pulses matches the number of sample bits. [Aligned format, with CONFIG.SWIDTH configured to 16-bit samples in a 24-bit half-frame](#) on page 317 illustrates a configuration with greater half-frame width than sample width. The number of SCK pulses are greater than the number of sample bits, with the sample being left-aligned in the half-frame.

Figure 74: Aligned format, with `CONFIG.SWIDTH` configured to 16 bit samples in a 16 bit half-frame

Figure 75: Aligned format, with `CONFIG.SWIDTH` configured to 16-bit samples in a 24-bit half-frame

The register `CONFIG.FORMAT` on page 333 is used to choose whether a word shall be aligned on the LRCK edge, or be delayed one bit period after this edge:

- When using Aligned format, the first bit in a half-frame gets sampled on the first rising edge of SCK following a LRCK edge, as illustrated in [Aligned format. Identical sample width and half-frame width. Left sample on high level of LRCK](#) on page 317. The left sample is transferred during the high half period of LRCK.
- When using  $I^2S$  format, the first bit in a half-frame (containing one left or right sample) gets sampled on the second rising edge of the SCK after a LRCK edge, as illustrated in  [\$I^2S\$  format. Identical sample width and half-frame width. Left sample on low level of LRCK](#) on page 317. The left sample is transferred during the low half period of LRCK.

Figure 76: Aligned format. Identical sample width and half-frame width. Left sample on high level of LRCK

Figure 77:  $I^2S$  format. Identical sample width and half-frame width. Left sample on low level of LRCK

If the half-frame width differs from the sample width, the sample value can be either right or left-aligned inside a half-frame, as specified in `CONFIG.ALIGN` on page 332

- When using left-alignment, each half-frame starts with the MSB of the sample value, as illustrated by [CONFIG.ALIGN set to left justified](#) on page 317.
- When using right-alignment, each half-frame ends with the LSB of the sample value. This is illustrated in [CONFIG.ALIGN set to right justified](#) on page 318.

Figure 78: `CONFIG.ALIGN` set to left justified

Figure 79: CONFIG.ALIGN set to right justified

## Slave mode considerations

In Slave mode, the sample width does not need to equal the half-frame width, or even frame size. This means that there can be extra or fewer SCK pulses per half-frame than what the sample and half-frame widths specified in [CONFIG.SWIDTH](#) on page 332 require.

In cases where **left-alignment** is used, and the number of SCK pulses per half-frame is **higher** than the configured width, the following will apply:

- For data received on SDIN, all bits after the least significant bit (LSB) of the word value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the word value will be 0.

In cases where **left-alignment** is used, and the number of SCK pulses per frame is **lower** than the word width, the following will apply:

- Data sent and received on SDOUT and SDIN will be truncated with the LSBs being removed first.

In cases where **right-alignment** is used, and the number of SCK pulses per frame is **higher** than the configured width, the following will apply:

- For data received on SDIN, all bits before the MSB of the word value will be discarded.
- For data sent on SDOUT, all bits after the LSB of the word value will be 0 (same behavior as for left-alignment).

In cases where **right-alignment** is used, and the number of SCK pulses per frame is **lower** than the configured width, the following will apply:

- Data received on SDIN will be sign-extended to the same number of bits as the sample width before being written to memory.
- Data sent on SDOUT will be truncated with the LSBs being removed first (same behavior as for left-alignment).

### 7.15.7 EasyDMA

The I<sup>2</sup>S module implements EasyDMA for accessing internal Data RAM without CPU intervention.

The source and destination pointers for the TX and RX data are configured in [TXD.PTR](#) on page 334 and [RXD.PTR](#) on page 334. The memory pointed to by these pointers will only be read or written when TX or RX are enabled in [CONFIG.TXEN](#) on page 330, and [CONFIG.RXEN](#) on page 330.

The addresses written to the pointer registers [TXD.PTR](#) on page 334 and [RXD.PTR](#) on page 334 are double-buffered in hardware. These double buffers are updated for every number of transmitted data words given by [RXTXD.MAXCNT](#) on page 334 read from/written to memory. The events TXPTRUPD and RXPTRUPD are generated whenever the TXD.PTR and RXD.PTR are transferred to these double buffers.

If [TXD.PTR](#) on page 334 is not pointing to the Data RAM region when transmission is enabled, or [RXD.PTR](#) on page 334 is not pointing to the Data RAM region when reception is enabled, an EasyDMA transfer may result in a HardFault and/or memory corruption. See [Memory](#) on page 21 for more information about the different memory regions.

Due to the nature of I<sup>2</sup>S, where the number of transmitted samples always equals the number of received samples (at least when both TX and RX are enabled), one common register [RXTXD.MAXCNT](#) on page 334 is used for specifying the sizes of these two memory buffers. The size of the buffers is specified in

a number of 32-bit words. Such a 32-bit memory word can either contain one 32-bit sample, one right-aligned 24-bit sample sign extended to 32-bit, two 16-bit samples or four 8-bit samples.

In Stereo mode ([CONFIG.CHANNELS](#) on page 333=Stereo), the samples are stored as left and right sample pairs in memory. [Memory mapping for 8-bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.](#) on page 319, [Memory mapping for 16-bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.](#) on page 319 and [Memory mapping for 24-bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.](#) on page 320 show how the samples are mapped to memory in this mode. The mapping is valid for both RX and TX.

In Mono mode ([CONFIG.CHANNELS](#) on page 333=Left or Right), RX sample from only one channel in the frame is stored in memory, the other channel sample is ignored. [Memory mapping for 8-bit mono. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.](#) on page 319, [Memory mapping for 16-bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.](#) on page 320 and [Memory mapping for 24-bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.](#) on page 320 show how RX samples are mapped to memory in this mode. For TX, the same outgoing sample read from memory is transmitted on both left and right in a frame, resulting in a mono output stream.

Figure 80: Memory mapping for 8-bit stereo. [CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Stereo.](#)

Figure 81: Memory mapping for 8-bit mono. [CONFIG.SWIDTH = 8Bit, CONFIG.CHANNELS = Left.](#)

Figure 82: Memory mapping for 16-bit stereo. [CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Stereo.](#)

Figure 83: Memory mapping for 16-bit mono, left channel only. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNELS = Left.

Figure 84: Memory mapping for 24-bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Stereo.

Figure 85: Memory mapping for 24-bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNELS = Left.

Figure 86: Memory mapping for 32-bit stereo. CONFIG.SWIDTH = 32Bit, CONFIG.CHANNELS = Stereo.

Figure 87: Memory mapping for 32-bit mono, left channel only. CONFIG.SWIDTH = 32Bit, CONFIG.CHANNELS = Left.

### 7.15.8 Module operation

Described here is a typical operating procedure for the I<sup>2</sup>S module.

#### 1. Configure the I<sup>2</sup>S module using the CONFIG registers

```
// Enable reception
NRF_I2S->CONFIG.RXEN = (I2S_CONFIG_RXEN_RXEN_Enabled <<
                        I2S_CONFIG_RXEN_RXEN_Pos);

// Enable transmission
NRF_I2S->CONFIG.TXEN = (I2S_CONFIG_TXEN_TXEN_Enabled <<
                        I2S_CONFIG_TXEN_TXEN_Pos);

// Enable MCK generator
NRF_I2S->CONFIG.MCKEN = (I2S_CONFIG_MCKEN_MCKEN_Enabled <<
                        I2S_CONFIG_MCKEN_MCKEN_Pos);

// MCKFREQ = 4 MHz
NRF_I2S->CONFIG.MCKFREQ = I2S_CONFIG_MCKFREQ_MCKFREQ_32MDIV8 <<
                        I2S_CONFIG_MCKFREQ_MCKFREQ_Pos;

// Ratio = 256
NRF_I2S->CONFIG.RATIO = I2S_CONFIG_RATIO_RATIO_256X <<
                        I2S_CONFIG_RATIO_RATIO_Pos;

// MCKFREQ = 4 MHz and Ratio = 256 gives sample rate = 15.625 ks/s
// Sample width = 16 bit
NRF_I2S->CONFIG.SWIDTH = I2S_CONFIG_SWIDTH_SWIDTH_16Bit <<
                        I2S_CONFIG_SWIDTH_SWIDTH_Pos;

// Alignment = Left
NRF_I2S->CONFIG.ALIGN = I2S_CONFIG_ALIGN_ALIGN_Left <<
                        I2S_CONFIG_ALIGN_ALIGN_Pos;

// Format = I2S
NRF_I2S->CONFIG.FORMAT = I2S_CONFIG_FORMAT_FORMAT_I2S <<
                        I2S_CONFIG_FORMAT_FORMAT_Pos;

// Use stereo
NRF_I2S->CONFIG.CHANNELS = I2S_CONFIG_CHANNELS_CHANNELS_Stereo <<
                        I2S_CONFIG_CHANNELS_CHANNELS_Pos;
```

## 2. Map IO pins using the PINSEL registers

```
// MCK routed to pin 0
NRF_I2S->PSEL.MCK = (0 << I2S_PSEL_MCK_PIN_Pos) |
                    (I2S_PSEL_MCK_CONNECT_Connected <<
                     I2S_PSEL_MCK_CONNECT_Pos);

// SCK routed to pin 1
NRF_I2S->PSEL.SCK = (1 << I2S_PSEL_SCK_PIN_Pos) |
                    (I2S_PSEL_SCK_CONNECT_Connected <<
                     I2S_PSEL_SCK_CONNECT_Pos);

// LRCK routed to pin 2
NRF_I2S->PSEL.LRCK = (2 << I2S_PSEL_LRCK_PIN_Pos) |
                     (I2S_PSEL_LRCK_CONNECT_Connected <<
                      I2S_PSEL_LRCK_CONNECT_Pos);

// SDOUT routed to pin 3
NRF_I2S->PSEL.SDOUT = (3 << I2S_PSEL_SDOUT_PIN_Pos) |
                      (I2S_PSEL_SDOUT_CONNECT_Connected <<
                       I2S_PSEL_SDOUT_CONNECT_Pos);

// SDIN routed on pin 4
NRF_I2S->PSEL.SDIN = (4 << I2S_PSEL_SDIN_PIN_Pos) |
                     (I2S_PSEL_SDIN_CONNECT_Connected <<
                      I2S_PSEL_SDIN_CONNECT_Pos);
```

## 3. Configure TX and RX data pointers using the TXD, RXD and RXTXD registers

```
NRF_I2S->TXD.PTR = my_tx_buf;
NRF_I2S->RXD.PTR = my_rx_buf;
NRF_I2S->TXD.MAXCNT = MY_BUF_SIZE;
```

## 4. Enable the I<sup>2</sup>S module using the ENABLE register

```
NRF_I2S->ENABLE = 1;
```

## 5. Start audio streaming using the START task

```
NRF_I2S->TASKS_START = 1;
```

## 6. Handle received and transmitted data when receiving the TXPTRUPD and RXPTRUPD events

```
if (NRF_I2S->EVENTS_TXPTRUPD != 0)
{
    NRF_I2S->TXD.PTR = my_next_tx_buf;
    NRF_I2S->EVENTS_TXPTRUPD = 0;
}

if (NRF_I2S->EVENTS_RXPTRUPD != 0)
{
    NRF_I2S->RXD.PTR = my_next_rx_buf;
    NRF_I2S->EVENTS_RXPTRUPD = 0;
}
```

## 7.15.9 Pin configuration

The MCK, SCK, LRCK, SDIN and SDOUT signals associated with the I<sup>2</sup>S module are mapped to physical pins according to the pin numbers specified in the PSEL.x registers.

These pins are acquired whenever the I<sup>2</sup>S module is enabled through the register [ENABLE](#) on page 329.

When a pin is acquired by the I<sup>2</sup>S module, the direction of the pin (input or output) will be configured automatically, and any pin direction setting done in the GPIO module will be overridden. The directions for the various I<sup>2</sup>S pins are shown below in [GPIO configuration before enabling peripheral \(Master mode\)](#) on page 323 and [GPIO configuration before enabling peripheral \(Slave mode\)](#) on page 323.

To secure correct signal levels on the pins in System OFF mode, and when the I<sup>2</sup>S module is disabled, these pins must be configured in the GPIO peripheral directly.

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Output    | 0              |         |
| SCK                     | As specified in PSEL.SCK   | Output    | 0              |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 36: GPIO configuration before enabling peripheral (Master mode)

| I <sup>2</sup> S signal | I <sup>2</sup> S pin       | Direction | Output value   | Comment |
|-------------------------|----------------------------|-----------|----------------|---------|
| MCK                     | As specified in PSEL.MCK   | Output    | 0              |         |
| LRCK                    | As specified in PSEL.LRCK  | Input     | Not applicable |         |
| SCK                     | As specified in PSEL.SCK   | Input     | Not applicable |         |
| SDIN                    | As specified in PSEL.SDIN  | Input     | Not applicable |         |
| SDOUT                   | As specified in PSEL.SDOUT | Output    | 0              |         |

Table 37: GPIO configuration before enabling peripheral (Slave mode)

## 7.15.10 Registers

### Instances

| Instance  | Domain      | Base address | TrustZone |     |     | Split access | Description              |
|-----------|-------------|--------------|-----------|-----|-----|--------------|--------------------------|
|           |             |              | Map       | Att | DMA |              |                          |
| I2S0 : S  | APPLICATION | 0x50028000   | US        | S   | SA  | No           | Inter-IC sound interface |
| I2S0 : NS |             | 0x40028000   |           |     |     |              |                          |

### Configuration

| Instance  | Domain      | Configuration |
|-----------|-------------|---------------|
| I2S0 : S  | APPLICATION |               |
| I2S0 : NS |             |               |

### Register overview

| Register                    | Offset | TZ | Description                                                                    |
|-----------------------------|--------|----|--------------------------------------------------------------------------------|
| <a href="#">TASKS_START</a> | 0x000  |    | Starts continuous I2S transfer. Also starts MCK generator when this is enabled |

| Register           | Offset | TZ | Description                                                                                                                                                                                                  |
|--------------------|--------|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_STOP         | 0x004  |    | Stops I2S transfer and MCK generator. Triggering this task will cause the event STOPPED to be generated.                                                                                                     |

### 7.15.10.5 EVENTS\_RXPTRUPD

Address offset: 0x104

The RXD.PTR register has been copied to internal double-buffers. When the I2S module is started and RX is enabled, this event will be generated for every RXTXD.MAXCNT words received on the SDIN pin.

### 7.15.10.7 EVENTS\_TXPTRUPD

Address offset: 0x114

The TDX.PTR register has been copied to internal double-buffers. When the I2S module is started and TX is enabled, this event will be generated for every RXTXD.MAXCNT words that are sent on the SDOUT pin.

 ## 7.15.11 Electrical specification

### 7.15.11.1 I2S timing specification

| Symbol          | Description                        | Min. | Typ. | Max.  | Units |
|-----------------|------------------------------------|------|------|-------|-------|
| $t_{S\_SDIN}$   | SDIN setup time before SCK rising  | 20   |      |       | ns    |
| $t_{H\_SDIN}$   | SDIN hold time after SCK rising    | 15   |      |       | ns    |
| $t_{S\_SDOUT}$  | SDOUT setup time after SCK falling |      |      | 50    | ns    |
| $t_{H\_SDOUT}$  | SDOUT hold time after SCK falling  | 13   |      |       | ns    |
| $t_{SCK\_LRCK}$ | SCLK falling to LRCK edge          | -5   | 0    | 5     | ns    |
| $f_{MCK}$       | MCK frequency                      |      |      | 12288 | kHz   |
| $f_{LRCK}$      | LRCK frequency                     |      |      | 96    | kHz   |
| $f_{SCK}$       | SCK frequency                      |      |      | 8000  | kHz   |
| $DC_{CK}$       | Clock duty cycle (MCK, LRCK, SCK)  | 45   |      | 55    | %     |

Figure 88: I2S timing diagram

## 7.16 IPC — Interprocessor communication

The interprocessor communication (IPC) peripheral is used to send and receive events between MCUs in the system.

The following figure illustrates the IPC peripheral in a multi-MCU system, where each MCU has one dedicated IPC peripheral. The IPC peripheral can be used to send and receive events to and from other IPC peripherals.

Figure 89: IPC block diagram

An instance of the IPC peripheral can have multiple SEND tasks and RECEIVE events. A single SEND task can be configured to signal an event on one or more IPC channels, and a RECEIVE event can be configured to listen on one or more IPC channels. The IPC channels that are triggered in a SEND task can be configured through the [SEND\\_CNF](#) registers, and the IPC channels that trigger a RECEIVE event are configured through the [RECEIVE\\_CNF](#) registers. The figure below illustrates how the [SEND\\_CNF](#) and [RECEIVE\\_CNF](#) registers work. Both the SEND task and the RECEIVE event can be connected to all IPC channels.

Figure 90: IPC registers *SEND\_CNF* and *RECEIVE\_CNF*

A SEND task can be viewed as broadcasting events onto one or more IPC channels, and a RECEIVE event can be seen as subscribing to a subset of IPC channels. It is possible for multiple IPCs to trigger events onto the same PPI channel at the same time. When two or more events on the same channel occur within  $t_{IPC}$ , the events may be merged into a single event seen from the IPC receiver. One of the events can therefore be lost. To prevent this, the user must ensure that events on the same IPC channel do not occur within  $t_{IPC}$  of each other. When implementing firmware data structures, such as queues or mailboxes, this can be done by using one IPC channel for acknowledgements.

An IPC event often does not contain any data itself, it is used to signal other MCUs that something has occurred. Data can be shared through shared memory, for example in the form of a software implemented mailbox, or command/event queues. It is up to software to assign a logical functionality to an IPC channel. For instance, one IPC channel can be used to signal that a command is ready to be executed, and any processor in the system can subscribe to that particular IPC channel and decode/execute the command.

The time it takes to transfer an IPC event varies depending on the state of the receiving MCU subsystem. A receiving MCU subsystem in the IDLE state (CPU and all peripherals are sleeping) has a greater latency than in the RUN state. IPC does not guarantee jitter-free transfer of accurate timing information between MCU subsystems.

## General purpose memory

The **GPMEM** registers can be used freely to store information. These registers are accessed like any other of the IPC peripheral's registers. Note that the contents of the GPMEM registers are not shared between the instances of the peripherals. I.e. writing the GPMEM register of one peripheral does not change the value in another.

### 7.16.1 IPC and PPI connections

The IPC SEND tasks and RECEIVE events can be connected through PPI channels. This makes it possible to relay events from peripherals in one MCU to another, without CPU involvement.

Figure below illustrates a timer COMPARE event that is relayed from one MCU to IPC using PPI, then back into a timer CAPTURE event in another MCU.

Figure 91: Example of PPI and IPC connections

### 7.16.2 Registers

#### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split access | Description                  |
|----------|-------------|--------------|-----------|-----|-----|--------------|------------------------------|
|          |             |              | Map       | Att | DMA |              |                              |
| IPC : S  | APPLICATION | 0x5002A000   | US        | S   | NA  | No           | Interprocessor communication |
| IPC : NS |             | 0x4002A000   |           |     |     |              |                              |
| IPC      | NETWORK     | 0x41012000   | HF        | NS  | NA  | No           | Interprocessor communication |

#### Register overview

| Register           | Offset | TZ | Description                                                                 |

## 7.17 KMU — Key management unit

The key management unit (KMU) enforces access policies to a subset region of user information configuration register (UICR). This subset region is used for storing cryptographic key values inside the key slots, which the CPU has no access to.

In total there are 128 key slots available, where each key slot can store one 128-bit key value together with an access policy and a destination address for the key value. Multiple key slots can be combined in order to support key sizes larger than 128 bits. The access policy of a key slot governs if and how a key value can be used, while the destination address determines where in the memory map the KMU pushes the key value upon a request from the CPU.

Key slots can be configured to be pushed directly into write-only key registers in cryptographic accelerators, like e.g. CryptoCell, without exposing the key value itself to the CPU. This enables the CPU to use the key values stored inside the key slots for cryptographic operations without being exposed to the key value.

Access to the KMU, and the key slots in the UICR, is only allowed from secure mode.

### 7.17.1 Functional view

From a functional view the UICR is divided into two different regions, one-time programmable (OTP) memory and key storage.

Figure 92: Memory map overview

One-time programmable (OTP) memory is typically used for holding values that are written once, and then never to be changed again throughout the product lifetime. The OTP region of UICR is emulated by placing a write-once per halfword limitation on registers defined here.

The key storage region contains multiple key slots, where each slot consists of a key header and an associated key value. The key value is limited to 128 bits. Any key size greater than 128 bits must be divided and distributed over multiple key slot instances.

Key headers are allocated an address range of 0x400 in the UICR memory map, allowing a total of 128 keys to be addressable inside the key storage region.

**Note:** The use of the key storage region in UICR should be limited to keys with a certain life span, and not per-session derived keys where the CPU is involved in the key exchange.

### 7.17.2 Access control

Access control to the underlying UICR infopage in flash is enforced by a hardware finite-state machine (FSM). The FSM can allow or block transactions, depending both on the security of the transaction (secure or non-secure) and on the type of register being written and/or read.

| Access type | Key headers | Key values |
|-------------|-------------|------------|
| Read        | Allowed     | Restricted |
| Write       | Restricted  | Restricted |

Table 38: Access control

Any restricted access requires an explicit key slot selection through the KMU register interface. Any illegal access to restricted key slot registers will be blocked and word 0xDEADDEAD will be returned on the AHB.

The OTP region has individual access control behavior, while access control to the key storage region is configured on a per key slot basis. The KMU FSM operates on only one key slot instance at a time, and the permissions and the usage restriction for a key value associated with a key slot can be configured individually.

**Note:** Even if the KMU can be configured as non-secure, all non-secure transactions will be blocked.

### 7.17.3 Protecting the UICR content

The UICR content can be protected against device-internal NVMC.ERASEALL requests, in addition to device-external ERASEALL requests, through the CTRL-AP interface. This feature is useful if the firmware designers want to prevent the OTP region from being erased.

Since enabling this step will permanently disable erase for the UICR, the procedure requires an implementation defined 32-bit word to be written into the UICR's ERASEPROTECT register.

In case of a field return handling, it is still possible to erase the UICR even if the ERASEPROTECT is set. If this functionality is desired, the secure boot code must implement a secure communication channel over the CTRL-AP mailbox interface. Upon successful authentication of the external party, the secure boot code can temporarily re-enable the CTRL-AP ERASEALL functionality.

### 7.17.4 Usage

This section describes the specific KMU and UICR behavior in more detail, to help the reader get a better overview of KMU's features and the intended usage.

#### 7.17.4.1 OTP

The OTP region of the UICR contains a user-defined static configuration of the device. The KMU emulates the OTP functionality by placing a write-once per halfword limitation of registers defined in this region, i.e. only halfwords containing all '1's can be written.

Any access, both read and write, to the OTP region of UICR must be a full 32-bit word aligned to a 32-bit address.

An OTP write transaction must consist of a full 32-bit word. Both halfwords can either be written simultaneously or one at a time. The KMU FSM will block any write to a halfword in the OTP region, if the initial value of this halfword is not `0xFFFF`. When writing halfwords one at a time, the non-active halfword must be masked as `0xFFFF`, otherwise the request will be blocked. For example, writing `0x1234XXXX` to an OTP destination address which already contains the value `0xFFFFAABB`, must be configured as `0x1234FFFF`. The OTP destination address will contain the value `0x1234AABB` after both write transactions have been processed.

The KMU will also only allow secure AHB write transactions into the OTP region of the UICR. Any AHB write transaction to this region that does not satisfy the above requirements will be ignored, and the `STATUS.BLOCKED` register will be set to '1'.

#### 7.17.4.2 Key storage

The key storage region of the UICR can contain multiple keys of different type, including symmetrical keys, hashes, public/private key pairs and other device secrets. One of the key features of the KMU, is that these device secrets can be installed and made available for use in cryptographic operations without revealing the actual secret values.

Keys in this region will typically have a certain life span. The region is not designed to be used for per-session derived keys where the non-secure side (i.e. application) is participating in the key exchange.

All key storage is done through the concept of multiple key slots, where each key slot instance consists of one key header and an associated key value. Each key header supports the configuration of usage permissions and an optional secure destination address.

The key header secure destination address option enables the KMU to push the associated key value over a dedicated secure APB to a pre-configured secure location within the memory map. Such locations typically include a write-only key register of the hardware cryptographic accelerator, allowing the KMU to distribute keys within the system without compromising the key values.

One key slot instance can store a key value of maximum 128 bits. If a key size exceeds this limit, the key value itself must be split over multiple key slot instances.

The following usage and read permissions scheme is applicable for each key slot:

| State          | Push            | Read            | Write           | Description                                                                                                                       |
|----------------|-----------------|-----------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Active (1)     | Enabled<br>(1)  | Enabled<br>(1)  | Enabled<br>(1)  | Default flash erase value. Key slot cannot be pushed, write is enabled.                                                           |
| Active (1)     | Enabled<br>(1)  | Enabled<br>(1)  | Disabled<br>(0) | Key slot is active, push is enabled. Key slot VALUE registers can be read, but write is disabled.                                 |
| Active (1)     | Enabled<br>(1)  | Disabled<br>(0) | Disabled<br>(0) | Key slot is active, push is enabled. Read and write to key slot VALUE registers are disabled.                                     |
| Active (1)     | Disabled<br>(0) | Enabled<br>(1)  | Disabled<br>(0) | Key slot is active, push is disabled. Key slot VALUE registers can be read, but write is disabled.                                |
| Revoked<br>(0) | -               | -               | -               | Key slot is revoked and key value is set to zero. Cannot be read or pushed over secure APB regardless of the permission settings. |

Table 39: Valid key slot permission schemes

##### 7.17.4.2.1 Selecting a key slot

The KMU FSM is designed to process only one key slot at a time, effectively operating as a memory protection unit for the key storage region. Whenever a key slot is selected, the KMU will allow access to writing, reading, and/or pushing the associated key value according to the selected slot configuration.

A key slot must be selected prior to use, by writing the key slot ID into the KMU `SELECTKEYSLOT` register. Because the reset value of this register is `0x00000000`, there is no key slot associated with `ID=0` and no slot is selected by default. All key slots are addressed using IDs from 1 to 128.

SELECTED status is set when a key slot is selected, and a read or write access to that keyslot occurs.

BLOCKED status is set when any illegal access to key slot registers is detected.

When the use of the particular key slot is stopped, the key slot selection in SELECTKEYSLOT must be set back to 0.

By default, all KMU key slots will consist of a 128-bit key value of '1's, where the key headers have no secure destination address, or any usage and read restrictions.

#### 7.17.4.2.2 Writing to a key slot

Writing a key slot into UICR is a five-step process.

1. Select which key slot the KMU shall operate on by writing the desired key slot ID into the KMU SELECTKEYSLOT register. The selected key slot must be empty in order to add a new entry to UICR.
2. If the key value shall be pushable over secure APB, the destination address of the recipient must be configured in register KEYSLOT.CONFIG[ID-1].DEST.
3. Write the 128-bit key value into KEYSLOT.KEY[ID-1].VALUE[0-3].
4. Write the desired key slot permissions into KEYSLOT.CONFIG[ID-1].PERM, including any applicable usage restrictions.
5. Select key slot 0.

In case the total key size is greater than 128 bits, the key value itself must be split into 128-bit segments and written to multiple key slot instances. Steps 1 through 5 above must be repeated for the entire key size.

**Note:** If a key slot is configured as readable, and KEYSLOT.CONFIG[ID-1].DEST is not to be used, it is recommended to disable the push bit in KEYSLOT.CONFIG[ID-1].PERM when configuring key slot permissions.

**Note:** A key value distributed over multiple key slots should use the same key slot configuration in its key headers, but the secure destination address for each key slot instance must be incremented by 4 words (128 bits) for each key slot instance spanned.

**Note:** Write to flash must be enabled in NVMC->CONFIG prior to writing keys to flash, and subsequently disabled once writing is complete.

Steps 1 through 5 above will be blocked if any of the following violations are detected:

- No key slot selected
- Non-empty key slot selected
- NVM destination address not empty
- AHB write to KEYSLOT.KEY[ID-1].VALUE[0-3] registers not belonging to selected key slot

#### 7.17.4.2.3 Reading a key value

Key slots that are configured as readable can have their key value read directly from the UICR memory map by the CPU.

Readable keys are typically used during the secure boot sequence, where the CPU is involved in falsifying or verifying the integrity of the system. Since the CPU is involved in this decision process, it makes little sense not to trust the CPU having access to the actual key value but ultimately trust the decision of the integrity check. Another use-case for readable keys is if the key type in question does not have a HW peripheral in the platform that is able to accept such keys over secure APB.

Reading a key value from the UICR is a three-step process:

1. Select the key slot which the KMU shall operate on by writing the desired key slot ID into KMU->SELECTKEYSLOT.

2. If STATE and READ permission requirements are fulfilled as defined in KEYSLOT.CONFIG[ID-1].PERM, the key value can be read from region KEYSLOT.KEY[ID-1].VALUE[0-3] for selected key slot.
3. Select key slot 0.

Step 2 will be blocked and word 0xDEADDEAD will be returned on AHB if any of the following violations are detected:

- No key slot selected
- Key slot not configured as readable
- Key slot is revoked
- AHB read to KEYSLOT.KEY[ID-1].VALUE[0-3] registers not belonging to selected key slot

#### 7.17.4.2.4 Push over secure APB

Key slots that are configured as non-readable cannot be read by the CPU regardless of the mode the system is in, and must be pushed over secure APB in order to use the key value for cryptographic operations.

The secure APB destination address is set in the key slot configuration DEST register. Such destination addresses are typically write-only key registers in a hardware cryptographic accelerators memory map. The secure APB allows key slots to be utilized by the software side, without exposing the key value itself.

Pushing a key slot over secure APB is a four-step process:

1. Select the key slot on which the KMU shall operate by writing the desired key slot ID into KMU->SELECTKEYSLOT.
2. Start TASKS\_PUSH\_KEYSLLOT to initiate a secure APB transaction, writing the 128-bit key value associated with the selected key slot into address defined in KEYSLOT.CONFIG[ID-1].DEST.
3. After completing the secure APB transaction, the 128-bit key value is ready for use by the peripheral and EVENTS\_KEYSLLOT\_PUSHED is triggered.
4. Select key slot 0.

**Note:** If a key value is distributed over multiple key slots due to its key size, exceeding the maximum 128-bit key value limitation, then each distributed key slot must be pushed individually in order to transfer the entire key value over secure APB.

Step 3 will trigger other events than EVENTS\_KEYSLLOT\_PUSHED if the following violations are detected:

- EVENTS\_KEYSLLOT\_ERROR:
  - If no key slot is selected
  - If a key slot has no destination address configured
  - If when pushing a key slot, flash or peripheral returns an error
  - If pushing a key slot when push permissions are disabled
  - If attempting to push a key slot with default permissions
- EVENTS\_KEYSLLOT\_REVOKED if a key slot is marked as revoked in its key header configuration

#### 7.17.4.2.5 Revoking the key slots

All key slots within the key storage area can be marked as revoked.

To revoke any key slots, write to the STATE field in the KEYSLOT.CONFIG[ID-1].PERM register. The following rules apply to keys that have been revoked:

1. Key slots that have the PUSH field enabled in PERM register can no longer be pushed. If a revoked key slot is selected and task TASKS\_PUSH\_KEYSLLOT is started, the event EVENTS\_KEYSLLOT\_REVOKED is triggered.
2. Key slots that have the READ field enabled in PERM register are invalidated. Any read operation to a revoked key value will return the fixed value 3735936685.

- Previously pushed key values stored in a peripheral write-only key register are not affected by key revocation. If secure code wants to enforce that a revoked key is no longer usable by a peripheral for cryptographic operations, the secure code should disable or reset the peripheral in question.

**Note:** If a key slot is revoked, the KMU will automatically zeroize the associated VALUE registers.

### 7.17.4.3 STATUS register

The KMU uses a STATUS register to indicate its status of operation. The SELECTED bit will be asserted whenever the currently selected key slot is successfully read from or written to.

All read or write operations to other key slots than what is currently selected in KMU->SELECTKEYSLOT will assert the BLOCKED bit. The BLOCKED bit will also be asserted if the KMU fails to select a key slot, or if a request has been blocked due to an access violation. Normal operation using the KMU should never trigger the BLOCKED bit. If this bit is triggered during the development phase, it indicates that the code is using the KMU incorrectly.

The STATUS register is reset every time register SELECTKEYSLOT is written.

## 7.17.5 Registers

### Instances

| Instance | Domain      | Base address | TrustZone |     |     | Split<br>access | Description         |
|----------|-------------|--------------|-----------|-----|-----|-----------------|---------------------|
|          |             |              | Map       | Att | DMA |                 |                     |
| KMU : S  | APPLICATION | 0x50039000   | HF        | S   | NA  | Yes             | Key management unit |
| KMU : NS |             | 0x40039000   |           |     |     |                 |                     |

### Register overview

| Register                | Offset | TZ | Description                                                                                       |
|-------------------------|--------|----|---------------------------------------------------------------------------------------------------|

## 7.18 LPCOMP — Low-power comparator

Low-power comparator (LPCOMP) compares an input voltage against a reference voltage.

Listed here are the main features of LPCOMP:

- 0 - VDD input range
- Ultra-low power
- Eight input options (**AIN0** to **AIN7**)
- Reference voltage options:
  - Two external analog reference inputs, or
  - 15-level internal reference ladder (VDD/16)
- Optional hysteresis enable on input
- Can be used as a wakeup source from System OFF mode

In System ON, the LPCOMP can generate separate events on rising and falling edges of a signal, or sample the current state of the pin as being above or below the selected reference. The block can be configured to use any of the analog inputs on the device. Additionally, the low-power comparator can be used as an analog wakeup source from System OFF or System ON. The comparator threshold can be programmed to a range of fractions of the supply voltage.

**Note:** LPCOMP cannot be used (STARTed) at the same time as COMP. Only one comparator can be used at a time.

Figure 93: Low-power comparator

The wakeup comparator (LPCOMP) compares an input voltage ( $V_{IN+}$ ), which comes from an analog input pin selected via the PSEL register, against a reference voltage ( $V_{IN-}$ ) selected via registers [REFSEL](#) on page 360 and [EXTREFSEL](#).

The [PSEL](#), [REFSEL](#), and [EXTREFSEL](#) registers must be configured before the LPCOMP is enabled through the [ENABLE](#) register.

The [HYST](#) register allows enabling an optional hysteresis in the comparator core. This hysteresis shall prevent noise on the signal to create unwanted events. Figure below illustrates the effect of an active hysteresis on a noisy input signal. It is disabled by default, and shall be configured before enabling LPCOMP as well.

Figure 94: Effect of hysteresis on a noisy input signal

The LPCOMP is started by triggering the START task. After a startup time of  $t_{LPCOMP,STARTUP}$ , the LPCOMP will generate a READY event to indicate that the comparator is ready to use and the output of the LPCOMP is correct. The LPCOMP will generate events every time  $V_{IN+}$  crosses  $V_{IN-}$ . More specifically, every time  $V_{IN+}$  rises above  $V_{IN-}$  (upward crossing) an UP event is generated along with a CROSS event. Every time  $V_{IN+}$  falls below  $V_{IN-}$  (downward crossing), a DOWN event is generated along with a CROSS event. When hysteresis is enabled, the upward crossing level becomes  $(V_{IN-} + VHYST/2)$ , and the downward crossing level becomes  $(V_{IN-} - VHYST/2)$ .

The LPCOMP is stopped by triggering the STOP task.

LPCOMP will be operational in both System ON and System OFF mode when it is enabled through the [ENABLE](#) register. See [POWER — Power control](#) on page 46 for more information about power modes. Note that it is not allowed to go to System OFF when a READY event is pending to be generated.

All LPCOMP registers, including [ENABLE](#), are classified as retained registers when the LPCOMP is enabled. However, when the device wakes up from System OFF, all LPCOMP registers will be reset.

The LPCOMP can wake up the system from System OFF by asserting the ANADETECT signal. The ANADETECT signal can be derived from any of the event sources that generate the UP, DOWN and CROSS events. In case of wakeup from System OFF, no events will be generated, only the ANADETECT signal. See the ANADETECT register ([ANADETECT](#) on page 361) for more information on how to configure the ANADETECT signal.

The immediate value of the LPCOMP can be sampled to [RESULT](#) on page 360 by triggering the SAMPLE task.

See [RESETREAS](#) on page 70 for more information on how to detect a wakeup from LPCOMP.

### 7.18.1 Shared resources

The LPCOMP shares analog resources with SAADC. While it is possible to use the SAADC at the same time as the LPCOMP, selecting the same analog input pin for both modules is not supported.

Additionally, LPCOMP shares registers and other resources with other peripherals that have the same ID as the LPCOMP. See [Peripherals with shared ID](#) on page 151 for more information.

The LPCOMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behavior.

## 7.18.2 Pin configuration

You can use the LPCOMP.PSEL register to select one of the analog input pins, **AIN0** through **AIN7**, as the analog input pin for the LPCOMP.

See [GPIO — General purpose input/output](#) on page 293 for more information about the pins. Similarly, you can use [EXTREFSEL](#) on page 361 to select one of the analog reference input pins, **AIN0** and **AIN1**, as input for AREF in case AREF is selected in [EXTREFSEL](#) on page 361. The selected analog pins will be acquired by the LPCOMP when it is enabled through [ENABLE](#) on page 360.

## 7.18.3 Registers

### Instances

| Instance    | Domain      | Base address | TrustZone |     |     | Split access | Description          |

## 7.19 MUTEX — Mutual exclusive peripheral

The MUTEX peripheral uses mutual exclusion to support locking a resource that is shared between different CPUs in the system. The shared resource can only be used by one of these cores during the duration that it is locked.

The MUTEX peripheral includes several mutex registers. Each mutex register contains one bit which indicates if it is in a locked or unlocked state. Reading or writing to a mutex register may impact its state.

When a mutex is read, the following conditions apply:

- If the state is locked, the MUTEX[i] state is unchanged (remains in a locked state) and reading the register will return '1'.
- If the state is unlocked, the MUTEX[i] state changes to the locked state and reading the register will return '0'.

When writing '0' to a mutex, the following occurs:

- If the state is unlocked, the MUTEX[i] state is unchanged (remains in unlocked state) and the store is ignored.
- If the state is locked, the MUTEX[i] state changes to the unlocked state.

**Note:** Faults are not managed by the peripheral. If a mutex is locked and a fault occurs, it is the responsibility of the fault handler to release the mutex. If a fault handler is not managing the mutex release, the mutex will stay locked.

The following figure illustrates the mutex state transitions.

Figure 95: MUTEX - state transitions

The following code is an example of how a mutex can be used by two different CPUs:

```

// CPU0 Polling the MUTEX[0] register
while (NRF_MUTEX->MUTEX[0]){ // Read MUTEX[0]
    // If a 0 is read, the mutex will lock
    // If a 1 is read, polling will continue
}
// CPU0 working on shared data related to the mutex
...
NRF_MUTEX->MUTEX[0] = 0; // Release the mutex

```

```

// CPU1 Polling the MUTEX[0] register
while (NRF_MUTEX->MUTEX[0]){ // Read MUTEX[0]
    // If a 0 is read, the mutex will lock
    // If a 1 is read, polling will continue
}
// CPU1 working on shared data related to the mutex
...
NRF_MUTEX->MUTEX[0] = 0; // Release the mutex

```

Only one CPU can access the mutex at a time, meaning the mutex must be released before being accessed by the another CPU. If the load operation occurs at the same time, a bus arbitration mechanism will ensure only one CPU gets the mutex.

## 7.19.1 Registers

### Instances

## 7.20 NFCT — Near field communication tag

The NFCT peripheral is an implementation of an NFC Forum compliant listening device NFC-A.

With appropriate software, the NFCT peripheral can be used as the listening device NFC-A as specified by the [NFC Forum](#).

Listed here are the main features for the NFCT peripheral:

- NFC-A listen mode operation
  - 13.56 MHz input frequency
  - Bit rate 106 kbps
- Wake-on-field low power field detection (SENSE) mode
- Frame assemble and disassemble for the NFC-A frames specified by the NFC Forum
- Programmable frame timing controller
- Integrated automatic collision resolution, cyclic redundancy check (CRC), and parity functions

Figure 96: NFCT block diagram

### 7.20.1 Overview

The NFCT peripheral contains a 13.56 MHz AM receiver and a 13.56 MHz load modulator with 106 kbps data rate as defined by the NFC Forum.

Figure 97: NFCT overview

When transmitting, the frame data will be transferred directly from RAM and transmitted with configurable frame type and delay timing. The system will be notified by an event whenever a complete frame is received or sent. The received frames will be automatically disassembled and the data part of the frame transferred to RAM.

The NFCT peripheral also supports the collision detection and resolution ("anticollision") as defined by the NFC Forum.

Wake-on-field is supported in SENSE mode while the device is either in System OFF or System ON mode. When the antenna enters an NFC field, an event will be triggered notifying the system to activate the NFCT functionality for incoming frames. In System ON, if the energy detected at the antenna increases beyond a threshold value, the module will generate a **FIELDDETECTED** event. When the strength of the field no longer supports NFC communication, the module will generate a **FIELDLOST** event. For the Low Power Field Detect threshold values, refer to **NFCT Electrical Specification** on page 400.

In System OFF, the NFCT Low Power Field Detect function can wake the system up through a reset. See **RESETREAS** on page 70 for more information on how to detect a wakeup from NFCT.

If the system is put into System OFF mode while a field is already present, the NFCT Low Power Field Detect function will wake the system up right away and generate a reset.

**Note:** As a consequence of a reset, NFCT is disabled, and therefore the reset handler will have to activate NFCT again and set it up properly.

The HFXO must be running before the NFCT peripheral goes into ACTIVATED state. Note that the NFCT peripheral calibration is automatically done on **ACTIVATE** task. The HFXO can be turned off when the NFCT peripheral goes into SENSE mode. The shortcut **FIELDDETECTED\_ACTIVATE** can be used when the HFXO is already running while in SENSE mode.

Outgoing data will be collected from RAM with the EasyDMA function and assembled according to the **TXD.FRAMECONFIG** register. Incoming data will be disassembled according to the **RXD.FRAMECONFIG** register and the data section in the frame will be written to RAM via the EasyDMA function.

The NFCT peripheral includes a frame timing controller that can be used to accurately control the inter-frame delay between the incoming frame and a corresponding outgoing frame. It also includes optional CRC functionality.

## 7.20.2 Operating states

Tasks and events are used to control the operating state of the peripheral. The module can change state by triggering a task, or when specific operations are finalized. Events and tasks allow software to keep track of and change the current state.

See [NFCT block diagram](#) on page 365 and [NFCT state diagram, automatic collision resolution enabled](#) on page 367 for more information. See *NFC Forum, NFC Activity Technical Specification* for description on NFCT operating states.

Figure 98: NFCT state diagram, automatic collision resolution enabled

Figure 99: NFCT state diagram, automatic collision resolution disabled

### Important:

- FIELDLOST event is not generated in SENSE mode.
- Sending SENSE task while field is still present does not generate [FIELDDETECTED](#) event.
- If the FIELDDETECTED event is cleared before sending the [ACTIVATE](#) task, then the FIELDDETECTED event shows up again after sending the ACTIVATE task. The shortcut FIELDDETECTED\_ACTIVATE can be used to avoid this condition.

### 7.20.3 Pin configuration

NFCT uses two pins to connect the antenna and these pins are shared with GPIOs.

The PROTECT field in the NFPINS register in UICR defines the usage of these pins and their protection level against excessive voltages. The content of the NFPINS register is reloaded at every reset. See [Pin assignments](#) on page 851 for the pins used by the NFCT peripheral.

When NFPINS.PROTECT=NFC, a protection circuit will be enabled on the dedicated pins, preventing the chip from being damaged in the presence of a strong NFC field. The protection circuit will short the two pins together if voltage difference exceeds approximately 2V. The GPIO function on those pins will also be disabled.

When NFPINS.PROTECT=Disabled, the device will not be protected against strong NFC field damages caught by a connected NFCT antenna, and the NFCT peripheral will not operate as expected, as it will never leave the DISABLE state.

The pins dedicated to the NFCT antenna function will have some limitation when the pins are configured for normal GPIO operation. The pin capacitance will be higher on those (refer to  $C_{PAD\_NFC}$  in the Electrical Specification of [GPIO — General purpose input/output](#) on page 293), and some increased leakage current between the two pins is to be expected if they are used in GPIO mode, and are driven to different logical values. To save power, the two pins should always be set to the same logical value whenever entering one of the device power saving modes. For details, refer to  $I_{NFC\_LEAK}$  in the Electrical Specification of [GPIO — General purpose input/output](#) on page 293.

### 7.20.4 EasyDMA

The NFCT peripheral implements EasyDMA for reading and writing of data packets from and to the Data RAM.

The NFCT EasyDMA utilizes a pointer called [PACKETPTR](#) on page 395 for receiving and transmitting packets.

The NFCT peripheral uses EasyDMA to read or write RAM, but not both at the same time. The event [RXFRAMESTART](#) indicates that the EasyDMA has started writing to the RAM for a receive frame and the event [RXFRAMEEND](#) indicates that the EasyDMA has completed writing to the RAM. Similarly, the event [TXFRAMESTART](#) indicates that the EasyDMA has started reading from the RAM for a transmit frame and the event [TXFRAMEEND](#) indicates that the EasyDMA has completed reading from the RAM. If a transmit and a receive operation is issued at the same time, the transmit operation would be prioritized.

Starting a transmit operation while the EasyDMA is writing a receive frame to the RAM will result in unpredictable behavior. Starting an EasyDMA operation when there is an ongoing EasyDMA operation may result in unpredictable behavior. It is recommended to wait for the [TXFRAMEEND](#) or [RXFRAMEEND](#) event for the ongoing transmit or receive before starting a new receive or transmit operation.

The [MAXLEN](#) on page 395 register determines the maximum number of bytes that can be read from or written to the RAM. This feature can be used to ensure that the NFCT peripheral does not overwrite, or read beyond, the RAM assigned to a packet. Note that if the [RXD.AMOUNT](#) or [TXD.AMOUNT](#) register indicates longer data packets than set in MAXLEN, the frames sent to or received from the physical layer will be incomplete. If that situation occurs in RX mode, the [OVERRUN](#) bit in the [FRAMESTATUS.RX](#) register will be set and an [RXERROR](#) event will be triggered.

**Important:** The [RXD.AMOUNT](#) and [TXD.AMOUNT](#) define a frame length in bytes and bits excluding start of frame (SoF), end of frame (EoF), and parity, but including CRC for [RXD.AMOUNT](#) only. Make sure to take potential additional bits into account when setting MAXLEN.

Only sending task [ENABLERXDATA](#) ensures that a new value in [PACKETPTR](#) pointing to the RX buffer in Data RAM is taken into account.

If PACKETPTR is not pointing to the Data RAM region, an EasyDMA transfer may result in a hard fault or RAM corruption. For more information about the different memory regions, see Chapter [Memory](#) on page 21.

The NFCT peripherals normally do alternative receive and transmit frames. Therefore, to prepare for the next frame, the PACKETPTR, MAXLEN, [TXD.FRAMECONFIG](#) and TXD.AMOUNT can be updated while the receive is in progress, and, similarly, the PACKETPTR, MAXLEN and [RXD.FRAMECONFIG](#) can be updated while the transmit is in progress. They can be updated and prepared for the next NFC frame immediately after the [STARTED](#) event of the current frame has been received. Updating the TXD.FRAMECONFIG and TXD.AMOUNT during the current transmit frame or updating RXD.FRAMECONFIG during current receive frame may cause unpredictable behaviour.

In accordance with *NFC Forum, NFC Digital Protocol Technical Specification*, the least significant bit (LSB) from the least significant byte (LSByte) is sent on air first. The bytes are stored in increasing order, starting at the lowest address in the EasyDMA buffer in RAM.

### 7.20.5 Frame assembler

The NFCT peripheral implements a frame assembler in hardware.

When the NFCT peripheral is in the ACTIVE\_A state, the software can decide to enter RX or TX mode. For RX mode, see [Frame disassembler](#) on page 370. For TX mode, the software must indicate the address of the source buffer in Data RAM and its size through programming the [PACKETPTR](#) and MAXLEN registers respectively, then issuing a STARTTX task.

MAXLEN must be set so that it matches the size of the frame to be sent.

The [STARTED](#) event indicates that the PACKETPTR and MAXLEN registers have been captured by the frame assembler EasyDMA.

When asserting the [STARTTX](#) task, the frame assembler module will start reading TXD.AMOUNT.TXDATABYTES bytes (plus one additional byte if TXD.AMOUNT.TXDATABITS > 0) from the RAM position set by the PACKETPTR.

The NFCT peripheral transmits the data as read from RAM, adding framing and the CRC calculated on the fly if set in TXD.FRAMECONFIG. The NFCT peripheral will take (8\*TXD.AMOUNT.TXDATABYTES + TXD.AMOUNT.TXDATABITS) bits and assemble a frame according to the settings in [TXD.FRAMECONFIG](#). Both short frames, standard frames, and bit-oriented SDD frames as specified in the *NFC Forum, NFC Digital Protocol Technical Specification* can be assembled by the correct setting of the TXD.FRAMECONFIG register.

The bytes will be transmitted on air in the same order as they are read from RAM with a rising bit order within each byte, least significant bit (LSB) first. That is, the least significant bit (b0) will be transmitted on air before the second bit (b1), and so on. The bits read from RAM will be coded into symbols as defined in the *NFC Forum, NFC Digital Protocol Technical Specification*.

**Note:** Some NFC Forum documents, such as *NFC Forum, NFC Digital Protocol Technical Specification*, define bit numbering in a byte from b1 (LSB) to b8 (most significant bit (MSB)), while most other technical documents from the NFC Forum, and also the Nordic Semiconductor documentation, traditionally number them from b0 to b7. The present document uses the b0–b7 numbering scheme. Be aware of this when comparing the *NFC Forum, NFC Digital Protocol Technical Specification* to others.

The frame assembler can be configured in TXD.FRAMECONFIG to add SoF symbol, calculate and add parity bits, and calculate and add CRC to the data read from RAM when assembling the frame. The total frame will then be longer than what is defined by TXD.AMOUNT.TXDATABYTES. TXDATABITS. DISCARDMODE will select if the first bits in the first byte read from RAM or the last bits in the last byte read from RAM will be discarded if TXD.AMOUNT.TXDATABITS are not equal to zero. Note that if TXD.FRAMECONFIG.PARITY

= Parity and TXD.FRAMECONFIG.DISCARDMODE=DiscardStart, a parity bit will be included after the non-complete first byte. No parity will be added after a non-complete last byte.

The frame assemble operation for different settings in TXD.FRAMECONFIG is illustrated in the following table. All shaded bit fields are added by the frame assembler. Some of these bits are optional and appearances are configured in TXD.FRAMECONFIG. Note that the frames illustrated do not necessarily comply with the NFC specification. The figure only illustrates the behavior of the NFCT peripheral.

#### Data from RAM

#### Frame on air

PARITY = Parity  
TXDATABITS = 0  
CRCMODETX = CRC16TX

PARITY = Parity  
TXDATABITS = 4  
CRCMODETX = NoCRCTX  
DISCARDMODE = DiscardStart

PARITY = Parity  
TXDATABITS = 0  
CRCMODETX = NoCRCTX

Figure 100: Frame assemble illustration

The accurate timing for transmitting the frame on air is set using the frame timing controller settings.

## 7.20.6 Frame disassembler

The NFCT peripheral implements a frame disassembler in hardware.

When the NFCT peripheral is in the ACTIVE\_A state, the software can decide to enter RX or TX mode. For TX mode, see [Frame assembler](#) on page 369. For RX mode, the software must indicate the address and size of the destination buffer in Data RAM through programming the [PACKETPTR](#) and [MAXLEN](#) registers before issuing an [ENABLERXDATA](#) task.

The [STARTED](#) event indicates that the [PACKETPTR](#) and [MAXLEN](#) registers have been captured by the frame disassembler EasyDMA.

When an incoming frame starts, the [RXFRAMESTART](#) event will get issued and data will be written to the buffer in Data RAM. The frame disassembler will verify and remove any parity bits, start of frame (SoF) and end of frame (EoF) symbols on the fly based on [RXD.FRAMECONFIG](#) register configuration. It will, however, verify and transfer the CRC bytes into RAM, if the CRC is enabled through [RXD.FRAMECONFIG](#).

When an EoF symbol is detected, the NFCT peripheral will assert the [RXFRAMEEND](#) event and write the [RXD.AMOUNT](#) register to indicate numbers of received bytes and bits in the data packet. The module does not interpret the content of the data received from the remote NFC device, except for SoF, EoF, parity, and CRC checking, as described above. The frame disassemble operation is illustrated in the following figure.

**Frame on air**

PARITY = Parity  
 RXDATABITS = 0  
 CRCMODERX = CRC16RX

PARITY = Parity  
 CRCMODERX = NoCRCTR  
 RXDATABITS = 4

PARITY = NoParity  
 CRCMODERX = NoCRCRX  
 RXDATABITS = 0

**Data to RAM**

Figure 101: Frame disassemble illustration

Per NFC specification, the time between EoF to the next SoF can be as short as 86  $\mu$ s, and therefore care must be taken that PACKETPTR and MAXLEN are ready and ENABLERXDATA is issued on time after the end of previous frame. The use of a PPI shortcut from [TXFRAMEEND](#) to ENABLERXDATA is recommended.

## 7.20.7 Frame timing controller

The NFCT peripheral includes a frame timing controller that continuously keeps track of the number of the 13.56 MHz RF carrier clock periods since the end of the EoF of the last received frame.

The NFCT peripheral can be programmed to send a responding frame within a time window or at an exact count of RF carrier periods. In case of [FRAMEDELAYMODE](#) = Window, a [STARTTX](#) task triggered before the frame timing controller counter is equal to [FRAMEDELAYMIN](#) will force the transmission to halt until the counter is equal to [FRAMEDELAYMIN](#). If the counter is within [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) when the [STARTTX](#) task is triggered, the NFCT peripheral will start the transmission straight away. In case of [FRAMEDELAYMODE](#) = ExactVal, a [STARTTX](#) task triggered before the frame delay counter is equal to [FRAMEDELAYMAX](#) will halt the actual transmission start until the counter is equal to [FRAMEDELAYMAX](#).

In case of [FRAMEDELAYMODE](#) = WindowGrid, the behaviour is similar to the [FRAMEDELAYMODE](#) = Window, but the actual transmission between [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) starts on a bit grid as defined for NFC-A Listen frames (slot duration of 128 RF carrier periods).

An [ERROR](#) event (with [FRAMEDElayTIMEOUT](#) cause in [ERRORSTATUS](#)) will be asserted if the frame timing controller counter reaches [FRAMEDELAYMAX](#) without any [STARTTX](#) task triggered. This may happen even when the response is not required as per *NFC Forum, NFC Digital Protocol Technical Specification*. Any commands handled by the automatic collision resolution that don't involve a response being generated may also result in an [ERROR](#) event (with [FRAMEDElayTIMEOUT](#) cause in [ERRORSTATUS](#)). The [FRAMEDELAYMIN](#) and [FRAMEDELAYMAX](#) values shall only be updated before the [STARTTX](#) task is triggered. Failing to do so may cause unpredictable behaviour.

The frame timing controller operation is illustrated in the following figure. The frame timing controller automatically adjusts the frame timing counter based on the last received data bit according to NFC-A technology in the *NFC Forum, NFC Digital Protocol Technical Specification*.

Figure 102: Frame timing controller (FRAMEDELAYMODE=Window)

### 7.20.8 Collision resolution

The NFCT peripheral implements an automatic collision resolution function as defined by the NFC Forum.

Automatic collision resolution is enabled by default, and it is recommended that the feature is used since it is power efficient and reduces the complexity of software handling the collision resolution sequence. This feature can be disabled through the MODE field in the [AUTOCOLRESCONFIG](#) register. When the automatic collision resolution is disabled, all commands will be sent over EasyDMA as defined in frame disassembler.

The [SENSRES](#) and [SELRES](#) registers need to be programmed upfront in order for the collision resolution to behave correctly. Depending on the NFCIDSIZE field in SENSRES, the following registers also need to be programmed upfront:

- NFCID1\_LAST if NFCID1SIZE=NFCID1Single (ID = 4 bytes);
- NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Double (ID = 7 bytes);
- NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST and NFCID1\_LAST if NFCID1SIZE=NFCID1Triple (ID = 10 bytes);

A pre-defined set of registers, NFC.TAGHEADER0..3, containing a valid NFCID1 value, is available in FICR and can be used by software to populate the NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST, and NFCID1\_LAST registers.

[NFCID1 byte allocation \(top sent first on air\)](#) on page 373 explains the position of the ID bytes in NFCID1\_3RD\_LAST, NFCID1\_2ND\_LAST, and NFCID1\_LAST, depending on the ID size, and as compared to the definition used in the *NFC Forum, NFC Digital Protocol Technical Specification*.

|          | ID = 4 bytes        | ID = 7 bytes        | ID = 10 bytes       |
|----------|---------------------|---------------------|---------------------|
| NFCID1_Q |                     |                     | nfcid1 <sub>0</sub> |
| NFCID1_R |                     |                     | nfcid1 <sub>1</sub> |
| NFCID1_S |                     |                     | nfcid1 <sub>2</sub> |
| NFCID1_T |                     | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> |
| NFCID1_U |                     | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> |
| NFCID1_V |                     | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> |
| NFCID1_W | nfcid1 <sub>0</sub> | nfcid1 <sub>3</sub> | nfcid1 <sub>6</sub> |
| NFCID1_X | nfcid1 <sub>1</sub> | nfcid1 <sub>4</sub> | nfcid1 <sub>7</sub> |
| NFCID1_Y | nfcid1 <sub>2</sub> | nfcid1 <sub>5</sub> | nfcid1 <sub>8</sub> |
| NFCID1_Z | nfcid1 <sub>3</sub> | nfcid1 <sub>6</sub> | nfcid1 <sub>9</sub> |

Table 40: NFCID1 byte allocation (top sent first on air)

The hardware implementation can handle the states from IDLE to ACTIVE\_A automatically as defined in the *NFC Forum, NFC Activity Technical Specification*, and the other states are to be handled by software. The software keeps track of the state through events. The collision resolution will trigger an **AUTOCOLRESSTARTED** event when it has started. Reaching the ACTIVE\_A state is indicated by the **SELECTED** event.

If collision resolution fails, a **COLLISION** event is triggered. Note that errors occurring during automatic collision resolution may also cause **ERROR** and/or **RXERROR** events to be generated. Other events may also get generated. It is recommended that the software ignores any event except COLLISION, SELECTED and FIELDLOST during automatic collision resolution. Software shall also make sure that any unwanted SHORT or PPI shortcut is disabled during automatic collision resolution.

The automatic collision resolution will be restarted, if the packets are received with CRC or parity errors while in ACTIVE\_A state. The automatic collision resolution feature can be disabled while in ACTIVE\_A state to avoid this.

The SLP\_REQ is automatically handled by the NFCT peripheral when the automatic collision resolution is enabled. However, this results in an ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS) since the SLP\_REQ has no response. This error must be ignored until the SELECTED event is triggered and this error should be cleared by the software when the SELECTED event is triggered.

## 7.20.9 Antenna interface

In ACTIVATED state, an amplitude regulator will adjust the voltage swing on the antenna pins to a value that is within the  $V_{\text{swing}}$  limit.

Refer to **NFCT Electrical Specification** on page 400.

## 7.20.10 NFCT antenna recommendations

The NFCT antenna coil must be connected differential between **NFC1** and **NFC2** pins of the device.

Two external capacitors should be used to tune the resonance of the antenna circuit to 13.56 MHz.

Figure 103: NFCT antenna recommendations

The required tuning capacitor value is given by the below equations:

$$C'_{tune} = \frac{1}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} \quad \text{where } C'_{tune} = \frac{1}{2} \cdot (C_p + C_{int} + C_{tune})$$

$$\text{and } C_{tune1} = C_{tune2} = C_{tune} \quad C_{p1} = C_{p2} = C_p \quad C_{int1} = C_{int2} = C_{int}$$

$$C_{tune} = \frac{2}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} - C_p - C_{int}$$

An antenna inductance of  $L_{ant} = 2 \mu\text{H}$  will give tuning capacitors in the range of 130 pF on each pin. The total capacitance on **NFC1** and **NFC2** must be matched.

### 7.20.11 Battery protection

If the antenna is exposed to a strong NFC field, current may flow in the opposite direction on the supply due to parasitic diodes and ESD structures.

If the battery used does not tolerate return current, a series diode must be placed between the battery and the device in order to protect the battery.

### 7.20.12 Digital Modulation Signal

Support for external analog frontends or antenna architectures is possible by optionally outputting the digital modulation signal to a GPIO.

The NFCT peripheral is designed to connect directly to a loop antenna, receive a modulated signal from an NFC Reader with its internal analog frontend and transmit data back by changing the input resistance that is then seen as modulated load by the NFC Reader.

In addition, the peripheral has an option to output the digital modulation signal to a GPIO. Reception still occurs through the internal analog frontend, whereas transmission can be done by one of the following:

- The internal analog frontend through the loop antenna (default)
- An external frontend using the digital modulation signal
- The combination of both above

There are two registers that allow configuration of the modulation signal (i.e. of the response from NFCT to the NFC Reader), [MODULATIONCTRL](#) and [MODULATIONPSEL](#). The registers need to be programmed before NFCT sends a response to a request from a reader. Ideally, this configuration is performed during startup and whenever the NFCT peripheral is powered up.

The selected GPIO needs to be configured as output in the corresponding GPIO configuration register. It is recommended to set an output value in the corresponding GPIO.OUT register – this value will be driven whenever the NFCT peripheral is disabled.

NFCT drives the pin low when there is no modulation, and drives it with On-Off Keying (OOK) modulation of an 847 kHz subcarrier (derived from the carrier frequency) when it responds to commands from an NFC Reader.

Marks the end of the first symbol of a received frame

## 7.20.14.21 EVENTS RXFRAMEEND

Received data has been checked (CRC, parity) and transferred to RAM, and EasyDMA has ended accessing the RX buffer

## 7.20.14.22 EVENTS ERROR

NFC error reported. The ERRORSTATUS register contains details on the source of the error.

### 7.20.14.23 EVENTS\_RXERROR

NFC RX frame error reported. The FRAMESTATUS.RX register contains details on the source of the error.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

#### 7.20.14.63 MODULATIONCTRL

Address offset: 0x52C

Enables the modulation output to a GPIO pin which can be connected to a second external antenna.

See [MODULATIONPSEL](#) for GPIO configuration.

## 7.20.14.68 AUTOCOLRESCONFIG

Address offset: 0x59C

Controls the auto collision resolution function. This setting must be done before the NFCT peripheral is activated.

**Note:** When modifying this register, bit 1 must be written to 1.

## 7.20.15 Electrical specification

### 7.20.15.1 NFCT Electrical Specification

| Symbol      | Description                                                                                                | Min. | Typ.  | Max. | Units |
|-------------|------------------------------------------------------------------------------------------------------------|------|-------|------|-------|
| $f_c$       | Frequency of operation                                                                                     |      | 13.56 |      | MHz   |
| $C_{MI}$    | Carrier modulation index                                                                                   | 95   |       |      | %     |
| DR          | Data Rate                                                                                                  |      | 106   |      | kbps  |
| $V_{sense}$ | Peak differential field detect threshold level on NFC1-NFC2, with input being high impedance in sense mode |      | 1.2   |      | Vp    |
| $I_{max}$   | Maximum input current on NFCT pins                                                                         |      |       | 80   | mA    |

### 7.20.15.2 NFCT Timing Parameters

| Symbol         | Description                                                                                                                          | Min. | Typ. | Max. | Units   |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------|------|------|------|---------|
| $t_{activate}$ | Time from task_ACTIVATE in SENSE or DISABLE state to ACTIVATE_A or IDLE state, excluding voltage supply and oscillator startup times |      |      | 500  | $\mu s$ |
| $t_{sense}$    | Time from remote field is present in SENSE mode to FIELDDETECTED event is asserted                                                   |      |      | 20   | $\mu s$ |

Figure 104: NFCT timing parameters (Shortcuts for FIELDDETECTED and FIELDLOST are disabled)

## 7.21 NVMC — Non-volatile memory controller

The non-volatile memory controller (NVMC) is used for writing and erasing of the internal flash memory and the user information configuration register (UICR).

The NVMC is a split security peripheral. This means that when the NVMC is configured as non-secure, only a subset of the registers is available from the non-secure code. See [SPU — System protection unit](#) on page 651 and [Registers](#) on page 403 for more details.

When the NVMC is configured to be a secure peripheral, only secure code has access.

Before a write can be performed, the NVMC must be enabled for writing in CONFIG.WEN. Similarly, before an erase can be performed, the NVMC must be enabled for erasing in CONFIG.EEN, see [CONFIG](#) on page 404. The user must make sure that writing and erasing are not enabled at the same time. Failing to do so may result in unpredictable behavior.

### 7.21.1 Writing to flash

When writing is enabled, in CONFIG register for secure region, or in CONFIGNS register for non-secure region, flash is written by writing a full 32-bit word to a word-aligned address in flash.

Secure code has access to both secure and non-secure regions, by using the appropriate configuration of CONFIG and CONFIGNS registers. Non-secure code, in contrast, has access to non-secure regions only. Thus, non-secure code only needs CONFIGNS.

The NVMC is only able to write 0 to erased bits in flash, that is bits set to 1. It cannot write a bit back to 1.

As illustrated in [Memory](#) on page 21, flash is divided into multiple pages. The same address in flash can only be written  $n_{\text{WRITE}}$  number of times before a page erase must be performed.

Only full 32-bit words can be written to flash using the NVMC interface. To write less than 32 bits to flash, write the data as a word, and set all the bits that should remain unchanged in the word to 1. The restriction about the number of writes (see above) still applies in this case.

The time it takes to write a word to flash is specified by  $t_{\text{WRITE}}$ . If CPU executes code from flash while the NVMC is writing to flash, the CPU will be stalled.

Only word-aligned writes are allowed. Byte or half-word-aligned writes will result in a bus fault.

### 7.21.2 Erasing a secure page in flash

When secure region erase is enabled (in CONFIG register), a flash page can be erased by writing 0xFFFFFFFF into the first 32-bit word in a flash page.

Page erase is only applicable to the code area in the flash and does not work with UICR.

After erasing a flash page, all bits in the page are set to 1. The time it takes to erase a page is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

See [Partial erase of a page in flash](#) for information on splitting the erase time in smaller chunks.

### 7.21.3 Erasing a non-secure page in flash

When non-secure region erase is enabled, a non-secure flash page can be erased by writing 0xFFFFFFFF into the first 32-bit word of the flash page.

Page erase is only applicable to the code area in the flash and does not work with UICR.

After erasing a flash page, all bits in the page are set to 1. The time it takes to erase a page is specified by  $t_{\text{ERASEPAGE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

### 7.21.4 Writing to user information configuration registers (UICR)

User information configuration registers (UICR) are written in the same way as flash. After UICR has been written, the new UICR configuration will only take effect after a reset.

UICR is only accessible by secure code. Any write from non-secure code will be faulted.

To lock the chip after uploading non-secure code, do the following steps:

1. Block access to secure code by setting UICR register to protected.

2. Use the register [WRITEUICRNS](#) on page 407, via non-secure debugger, to set APPROTECT (APPROTECT is automatically written to 0x00000000 by the NVMC).

UICR can only be written  $n_{\text{WRITE}}$  number of times before an erase must be performed using [ERASEALL](#).

The time it takes to write a word to the UICR is specified by  $t_{\text{WRITE}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC is writing to the UICR.

## 7.21.5 Erase all

When erase is enabled, the whole flash and UICR can be erased in one operation by using the ERASEALL register. ERASEALL will not erase the factory information configuration registers (FICR).

This functionality can be blocked by some configuration of the UICR protection bits, see the table [NVMC protection](#) on page 402.

The time it takes to perform an [ERASEALL](#) on page 405 command is specified by  $t_{\text{ERASEALL}}$ . The CPU is stalled if the CPU executes code from the flash while the NVMC performs the erase operation.

## 7.21.6 NVMC protection mechanisms

This chapter describes the different protection mechanisms for the non-volatile memory.

### 7.21.6.1 NVMC blocking

NVM integrity is assured through use of multiple levels of protection. Protection mechanisms can be configured to allow or block certain operations.

The table below shows the different status of protection bits, and which operations are allowed or blocked.

| Protection bit status                     |           |                  | NVMC protection  |               |
|-------------------------------------------|-----------|------------------|------------------|---------------|
| SECURE<br>APPROTECT                       | APPROTECT | ERASE<br>PROTECT | CTRL-AP ERASEALL | NVMC ERASEALL |
| 0                                         | 0         | 0                | Available        | Available     |
| 1                                         | X         | 0                | Available        | Blocked       |
| X                                         | 1         | 0                | Available        | Blocked       |
| X                                         | X         | 1                | Blocked          | Blocked       |
| 1 - Enabled, 0 - Disabled, X - Don't care |           |                  |                  |               |

Table 41: NVMC protection

## Uploading code with secure debugging blocked

Non-secure code can program non-secure flash regions. To perform these operations, the NVMC has the following non-secure registers: CONFIGNS, READY, and READYNEXT.

[CONFIGNS](#) on page 406 works as the CONFIG register but it is used only for non-secure transactions. Both page erase and writing inside the flash require a write transaction (see [Erasing a secure page in flash](#) on page 401 or [Erasing a non-secure page in flash](#) on page 401). Because of this, the [SPU — System protection unit](#) on page 651 will guarantee that the non-secure code cannot write inside a secure page, since the transaction will never reach the NVMC controller.

### 7.21.6.2 NVMC power failure protection

NVMC power failure protection is possible through the use of a power-fail comparator that is monitoring power supply.

If the power-fail comparator is enabled, and the power supply voltage is below  $V_{POF}$  threshold, the power-fail comparator will prevent the NVMC from performing erase or write operations in non-volatile memory (NVM).

If a power failure warning is present at the start of an NVM write or erase operation, the NVMC will block the operation and a bus error will be signalled. If a power failure warning occurs during an ongoing NVM write operation, the NVMC will try to finish the operation. And if the power failure warning persists, consecutive NVM write operations will be blocked by the NVMC, and a bus error will be signalled.

### 7.21.7 Cache

An instruction cache (I-Cache) can be enabled for the ICODE bus in the NVMC.

See [Memory](#) on page 21 for the location of flash.

A cache hit is an instruction fetch from the cache, and it has a 0 wait-state delay. The number of wait-states for a cache miss, where the instruction is not available in the cache and needs to be fetched from flash, depends on the processor frequency, see CPU parameter `W_FLASHCACHE`.

Enabling the cache can increase the CPU performance, and reduce power consumption by reducing the number of wait cycles and the number of flash accesses. This will depend on the cache hit rate. Cache draws current when enabled. If the reduction in average current due to reduced flash accesses is larger than the cache power requirement, the average current to execute the program code will be reduced.

When disabled, the cache does not draw current and its content is not retained.

It is possible to enable cache profiling to analyze the performance of the cache for your program using the register `ICACHECNF`. When profiling is enabled, registers `IHIT` and `IMISS` are incremented for every instruction cache hit or miss respectively.

### 7.21.8 Registers

#### Instances

| Instance  | Domain      | Base address | TrustZone |     |     | Split access | Description                    |
|-----------|-------------|--------------|-----------|-----|-----|--------------|--------------------------------|
|           |             |              | Map       | Att | DMA |              |                                |
| NVMC : S  | APPLICATION | 0x50039000   | US        | S   | NA  | Yes          | Non-volatile memory controller |
| NVMC : NS |             | 0x40039000   |           |     |     |              |                                |
| NVMC      | NETWORK     | 0x41080000   | HF        | NS  | NA  | No           | Non-Volatile Memory Controller |

#### Configuration

| Instance  | Domain      | Configuration                                                                                                                                                                               |
|-----------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NVMC : S  | APPLICATION | The application core has a separate CACHE peripheral. The NVMC <code>ICACHECNF</code> , <code>IHIT</code> and <code>IMISS</code> registers does not have an effect on the application core. |
| NVMC : NS |             | NVMC built-in cache not supported ( <code>ICACHECNF</code> , <code>IHIT</code> and <code>IMISS</code> registers).                                                                           |
| NVMC      | NETWORK     | NVMC TrustZone registers ( <code>WRITEUICRNS</code> and <code>CONFIGNS</code> ) not supported.                                                                                              |

## Register overview

| Register            | Offset | TZ | Description                                       |
|---------------------|--------|----|---------------------------------------------------|
| READY               | 0x400  | NS | Ready flag                                        |
| READYNEXT           | 0x408  | NS | Ready flag                                        |
| CONFIG              | 0x504  | S  | Configuration register                            |
| ERASEALL            | 0x50C  | S  | Register for erasing all non-volatile user memory |
| ERASEPAGEPARTIALCFG | 0x51C  | S  | Register for partial erase configuration          |
| ICACHECNF           | 0x540  | S  | I-code cache configuration register               |
| IHIT                | 0x548  | S  | I-code cache hit counter                          |
| IMISS               | 0x54C  | S  | I-code cache miss counter                         |
| CONFIGNS            | 0x584  | NS | Non-secure configuration register                 |
| WRITEUICRNS         | 0x588  | NS | Non-secure APPROTECT enable register              |

### 7.21.8.1 READY

Address offset: 0x400

Ready flag

|                  |     |       |          |       |                                                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |  |   |

 ## 7.21.9 Electrical specification

### 7.21.9.1 Flash programming

| Symbol                              | Description                                               | Min.  | Typ. | Max.               | Units |
|-------------------------------------|-----------------------------------------------------------|-------|------|--------------------|-------|
| $n_{\text{WRITE}}$                  | Number of times a 32-bit word can be written before erase |       |      | 2                  |       |
| $n_{\text{ENDURANCE}}$              | Erase cycles per page                                     | 10000 |      |                    |       |
| $t_{\text{WRITE}}$                  | Time to write one 32-bit word                             |       |      | 43 <sup>11</sup>   | μs    |
| $t_{\text{ERASEPAGE}}$              | Time to erase one page                                    |       |      | 87.5 <sup>11</sup> | ms    |
| $t_{\text{ERASEALL}}$               | Time to erase all flash                                   |       |      | 173 <sup>11</sup>  | ms    |
| $t_{\text{ERASEPAGEPARTIAL,setup}}$ | Setup time for one partial erase                          | ..    | ..   | ..                 | ms    |

### 7.21.9.2 Cache size

| Symbol                | Description       | Min. | Typ.               | Max. | Units |
|-----------------------|-------------------|------|--------------------|------|-------|
| Size <sub>ICODE</sub> | I-Code cache size |      | 2048 <sup>12</sup> |      | Bytes |

<sup>11</sup> Applies when HF XO is used. Timing varies according to HFINT accuracy when HFINT is used.

<sup>12</sup> Only applicable for network core. Application core has a separate cache, see [CACHE — Instruction/data cache](#) on page 112.

## 7.22 PDM — Pulse density modulation interface

The pulse density modulation (PDM) module enables input of pulse density modulated signals from external audio frontends, for example, digital microphones. The PDM module generates the PDM clock and supports single-channel or dual-channel (left and right) data input. Data is transferred directly to RAM buffers using EasyDMA.

Listed here are the main features for PDM:

- Up to two PDM microphones configured as a left/right pair using the same data input
- 16 kHz output sample rate, 16-bit samples
- EasyDMA support for sample buffering
- HW decimation filters
- Selectable ratio of 64 or 80 between PDM\_CLK and output sample rate

The PDM module illustrated below is interfacing up to two digital microphones with the PDM interface. EasyDMA is implemented to relieve the real-time requirements associated with controlling of the PDM slave from a low priority CPU execution context. It also includes all the necessary digital filter elements to produce pulse code modulation (PCM) samples. The PDM module allows continuous audio streaming.

Figure 105: PDM module

### 7.22.1 Master clock source selection

The master clock source can be configured in register [MCLKCONFIG](#) on page 420. Choose one of the following as the master clock source:

- 32 MHz peripheral clock (PCLK32M), synchronous to HFCLK.
- Audio PLL clock (ACLK) with configurable frequency.

The peripheral must be stopped before selecting the master clock source. The use of the STOP task and the STOPPED event is described in [Module operation](#) on page 409.

To improve the master clock accuracy and jitter performance, it is recommended (but not mandatory) that the PCLK32M source is running off the HFXO instead of the HFINT oscillator. The ACLK source requires the use of HFXO. See [CLOCK — Clock control](#) on page 72 for more information about starting HFXO for the relevant clock source.

### 7.22.2 Master clock generator

The master clock generator's PDMCLKCTRL register allows adjusting the PDM clock's frequency.

The master clock generator does not add any jitter to the HFCLK source chosen. It is recommended (but not mandatory) to use the Xtal as HFCLK source.

The following equation can be used to calculate the value of the PDMCLKCTRL register for a given PDM clock- and master clock source frequency:

$$PDMCLKCTRL = 4096 \cdot \left\lfloor \frac{f_{pdm} \cdot 1048576}{f_{source} + \frac{f_{pdm}}{2}} \right\rfloor$$

Figure 106: PDM clock frequency equation

Where  $f_{pdm}$  is the requested PDM clock frequency in Hz, and  $f_{source}$  is the master clock generator source in Hz. Because of rounding errors, an accurate PDM clock may not be achievable. The actual PDM frequency can be calculated using the equation below.

$$f_{actual} = \frac{f_{source}}{\left\lfloor \frac{1048576 \cdot 4096}{PDMCLKCTRL} \right\rfloor}$$

Figure 107: Actual PDM frequency

The clock error can be calculated using the equation below. The error  $e$  is the percentage difference from the requested  $f_{pdm}$  frequency.

$$e = 100 \cdot \frac{f_{actual} - f_{pdm}}{f_{pdm}} = 100 \cdot \frac{\frac{f_{source}}{\left\lfloor \frac{1048576 \cdot 4096}{PDMCLKCTRL} \right\rfloor} - f_{pdm}}{f_{pdm}}$$

Figure 108: PDM frequency error equation

The PDM frequency can be adjusted while the clock generator is running.

- For PCLK32M, by using PDMCLKCTRL
- For ACLK, by adjusting the audio clock source, see [CLOCK — Clock control](#) on page 72.

| Requested PDM frequency $f_{pdm}$ [Hz] | $f_{source}$ [Hz]  | RATIO | PDMCLKCTRL | Actual PDM frequency $f_{actual}$ [Hz] | Sample frequency [Hz] | Error [%] |
|----------------------------------------|--------------------|-------|------------|----------------------------------------|-----------------------|-----------|
| 1024000                                | 32000000 (PCLK32M) | 64    | 135274496  | 1032258.1                              | 16129.0               | 0.81      |
| 1280000                                | 32000000 (PCLK32M) | 80    | 168427520  | 1280000                                | 16000                 | 0         |
| 1024000                                | 12288000 (ACLK)    | 64    | 343597056  | 1024000                                | 16000                 | 0         |

Table 42: Configuration examples

### 7.22.3 Module operation

By default, bits from the left PDM microphone are sampled on PDM\_CLK falling edge, and bits for the right are sampled on the rising edge of PDM\_CLK, resulting in two bitstreams. Each bitstream is fed into a digital filter which converts the PDM stream into 16-bit PCM samples, then filters and down-samples them to reach the appropriate sample rate.

The EDGE field in the MODE register allows swapping left and right, so that left will be sampled on rising edge, and right on falling.

The PDM module uses EasyDMA to store the samples coming out from the filters into one buffer in RAM. Depending on the mode chosen in the OPERATION field in the MODE register, memory either contains

alternating left and right 16-bit samples (Stereo), or only left 16-bit samples (Mono). To ensure continuous PDM sampling, it is up to the application to update the EasyDMA destination address pointer as the previous buffer is filled.

The continuous transfer can be started or stopped by sending the START and STOP tasks. STOP becomes effective after the current frame has finished transferring, which will generate the STOPPED event. The STOPPED event indicates that all activity in the module is finished, and that the data is available in RAM (EasyDMA has finished transferring as well). Attempting to restart before receiving the STOPPED event may result in unpredictable behavior.

## 7.22.4 Decimation filter

In order to convert the incoming data stream into PCM audio samples, a decimation filter is included in the PDM interface module.

The input of the filter is the two-channel PDM serial stream (with left channel on clock high, right channel on clock low). Depending on the **RATIO** selected, its output is  $2 \times 16$ -bit PCM samples at a sample rate either 64 times or 80 times (depending on the **RATIO** register) lower than the PDM clock rate.

The filter stage of each channel is followed by a digital volume control, to attenuate or amplify the output samples in a range of -20 dB to +20 dB around the default (reset) setting, defined by  $G_{PDM, default}$ . The gain is controlled by the **GAINL** and **GAINR** registers.

As an example, if the goal is to achieve 2500 RMS output samples (16-bit) with a 1 kHz 90 dBA signal into a -26 dBFS sensitivity PDM microphone, do the following:

- Sum the PDM module's default gain ( $G_{PDM, default}$ ) and the gain introduced by the microphone and acoustic path of his implementation (an attenuation would translate into a negative gain)
- Adjust **GAINL** and **GAINR** by the above summed amount. Assuming that only the PDM module influences the gain, **GAINL** and **GAINR** must be set to  $-G_{PDM, default}$  dB to achieve the requirement.

With  $G_{PDM, default} = 3.2$  dB, and as **GAINL** and **GAINR** are expressed in 0.5 dB steps, the closest value to program would be 3.0 dB, which can be calculated as:

```
GAINL = GAINR = (DefaultGain - (2 * 3))
```

Remember to check that the resulting values programmed into **GAINL** and **GAINR** fall within **MinGain** and **MaxGain**.

## 7.22.5 EasyDMA

Samples will be written directly to RAM, and EasyDMA must be configured accordingly.

The address pointer for the EasyDMA channel is set in **SAMPLE.PTR** register. If the destination address set in **SAMPLE.PTR** is not pointing to the Data RAM region, an EasyDMA transfer may result in a **HardFault** or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions.

The DMA transfer supports Stereo (left and right 16-bit samples) and Mono (left only) data transfer as configured in the **OPERATION** field of the **MODE** register. The samples are stored little endian.

| MODE.OPERATION | Bits per sample | Result stored per RAM word | Physical RAM allocated (32-bit words) | Result boundary indexes in RAM | Note    |
|----------------|-----------------|----------------------------|---------------------------------------|--------------------------------|---------|
| Stereo         | 32 (2x16)       | L+R                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | $R0=[31:16]; L0=[15:0]$        | Default |
| Mono           | 16              | 2xL                        | $\text{ceil}(\text{SAMPLE.MAXCNT}/2)$ | $L1=[31:16]; L0=[15:0]$        |         |

Table 43: DMA sample storage

The destination buffer in RAM consists of one block, the size of which is set in SAMPLE.MAXCNT register. Format is number of 16-bit samples. The physical RAM allocated is always:

```
(RAM allocation, in bytes) = SAMPLE.MAXCNT * 2;
```

(but the mapping of the samples depends on MODE.OPERATION.

If OPERATION=Stereo, RAM will contain a succession of left and right samples.

If OPERATION=Mono, RAM will contain a succession of left only samples.

For a given value of SAMPLE.MAXCNT, the buffer in RAM can contain half the stereo sampling time as compared to the mono sampling time.

The PDM acquisition can be started by the START task, after the SAMPLE.PTR and SAMPLE.MAXCNT registers have been written. When starting the module, it will take some time for the filters to start outputting valid data. Transients from the PDM microphone itself may also occur. The first few samples (typically around 50) might hence contain invalid values or transients. It is therefore advised to discard the first few samples after a PDM start.

As soon as the STARTED event is received, the firmware can write the next SAMPLE.PTR value (this register is double-buffered), to ensure continuous operation.

When the buffer in RAM is filled with samples, an END event is triggered. The firmware can start processing the data in the buffer. Meanwhile, the PDM module starts acquiring data into the new buffer pointed to by SAMPLE.PTR, and sends a new STARTED event, so that the firmware can update SAMPLE.PTR to the next buffer address.

## 7.22.6 Hardware example

PDM can be configured with a single microphone (mono), or with two microphones.

When a single microphone is used, connect the microphone clock to CLK, and data to DIN.

Figure 109: Example of a single PDM microphone, wired as left

Figure 110: Example of a single PDM microphone, wired as right

Note that in a single microphone (mono) configuration, depending on the microphone's implementation, either the left or the right channel (sampled at falling or rising CLK edge respectively) will contain reliable data.

If two microphones are used, one of them has to be set as left, the other as right (L/R pin tied high or to GND on the respective microphone). It is strongly recommended to use two microphones of exactly the same brand and type so that their timings in left and right operation match.

Figure 111: Example of two PDM microphones

### 7.22.7 Pin configuration

The CLK and DIN signals associated to the PDM module are mapped to physical pins according to the configuration specified in the PSEL.CLK and PSEL.DIN registers respectively. If the CONNECT field in any PSEL register is set to Disconnected, the associated PDM module signal will not be connected to the required physical pins, and will not operate properly.

The PSEL.CLK and PSEL.DIN registers and their configurations are only used as long as the PDM module is enabled, and retained only as long as the device is in System ON mode. See [POWER — Power control](#) on page 46 for more information about power modes. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To ensure correct behavior in the PDM module, the pins used by the PDM module must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 412 before enabling the PDM module. This is to ensure that the pins used by the PDM module are driven correctly if the PDM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the PDM module is supposed to be connected to an external PDM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| PDM signal | PDM pin                  | Direction | Output value   | Comment |
|------------|--------------------------|-----------|----------------|---------|
| CLK        | As specified in PSEL.CLK | Output    | 0              |         |
| DIN        | As specified in PSEL.DIN | Input     | Not applicable |         |

 ## 7.23 PWM — Pulse width modulation

The pulse width modulation (PWM) module enables the generation of pulse width modulated signals on GPIO. The module implements an up or up-and-down counter with four PWM channels that drive assigned GPIOs.

The following are the main features of a PWM module:

- Programmable PWM frequency
- Up to four PWM channels with individual polarity and duty cycle values
- Edge or center-aligned pulses across PWM channels
- Multiple duty cycle arrays (sequences) defined in RAM
- Autonomous and glitch-free update of duty cycle values directly from memory through EasyDMA (no CPU involvement)
- Change of polarity, duty cycle, and base frequency possibly on every PWM period
- RAM sequences can be repeated or connected into loops

Figure 113: PWM module

### 7.23.1 Wave counter

The wave counter is responsible for generating the pulses at a duty cycle that depends on the compare values, and at a frequency that depends on COUNTERTOP.

There is one common 15-bit counter with four compare channels. Thus, all four channels will share the same period (PWM frequency), but can have individual duty cycle and polarity. The polarity is set by a value read from RAM (see figure [Decoder memory access modes](#) on page 425). Whether the counter counts up, or up and down, is controlled by the MODE register.

The timer top value is controlled by the COUNTERTOP register. This register value, in conjunction with the selected PRESCALER of the PWM\_CLK, will result in a given PWM period. A COUNTERTOP value smaller than the compare setting will result in a state where no PWM edges are generated. OUT[n] is held high, given that the polarity is set to FallingEdge. All compare registers are internal and can only be configured through decoder presented later. COUNTERTOP can be safely written at any time.

Sampling follows the START task. If DECODER.LOAD=WaveForm, the register value is ignored and taken from RAM instead (see section [Decoder with EasyDMA](#) on page 425 for more details). If DECODER.LOAD is anything else than the WaveForm, it is sampled following a STARTSEQ[n] task and when loading a new value from RAM during a sequence playback.

The following figure shows the counter operating in up mode (MODE=PWM\_MODE\_Up), with three PWM channels with the same frequency but different duty cycle:

Figure 114: PWM counter in up mode example - FallingEdge polarity

The counter is automatically reset to zero when COUNTERTOP is reached and OUT[n] will invert. OUT[n] is held low if the compare value is 0 and held high if set to COUNTERTOP, given that the polarity is set to

FallingEdge. Counter running in up mode results in pulse widths that are edge-aligned. The following is the code for the counter in up mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE       = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE         = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER    = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP   = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP         = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER      = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR   = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT   = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
                         PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up mode, the following formula can be used to compute the PWM period and the step size:

PWM period:  $T_{PWM(Up)} = T_{PWM\_CLK} * COUNTERTOP$

Step width/Resolution:  $T_{steps} = T_{PWM\_CLK}$

The following figure shows the counter operating in up-and-down mode (MODE=PWM\_MODE\_UpAndDown), with two PWM channels with the same frequency but different duty cycle and output polarity:

Figure 115: PWM counter in up-and-down mode example

The counter starts decrementing to zero when COUNTERTOP is reached and will invert the OUT[n] when compare value is hit for the second time. This results in a set of pulses that are center-aligned. The following is the code for the counter in up-and-down mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_UpAndDown << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR = ((uint32_t)(pwm_seq) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT = ((sizeof(pwm_seq) / sizeof(uint16_t)) <<
    PWM_SEQ_CNT_CNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

When the counter is running in up-and-down mode, the following formula can be used to compute the PWM period and the step size:

$$T_{\text{PWM(Up And Down)}} = T_{\text{PWM\_CLK}} * 2 * \text{COUNTERTOP}$$

$$\text{Step width/Resolution: } T_{\text{steps}} = T_{\text{PWM\_CLK}} * 2$$

### 7.23.2 Decoder with EasyDMA

The decoder uses EasyDMA to take PWM parameters stored in RAM and update the internal compare registers of the wave counter, based on the mode of operation.

PWM parameters are organized into a sequence containing at least one half word (16 bit). Its most significant bit[15] denotes the polarity of the OUT[n] while bit[14:0] is the 15-bit compare value.

|            |  |  |  | The DECODER register controls how the RAM content is interpreted and loaded into the internal compare registers. The LOAD field controls if the RAM values are loaded to all compare channels, or to update a group or all channels with individual values. The following figure illustrates how parameters stored in RAM are organized and routed to various compare channels in different modes:

Figure 116: Decoder memory access modes

A special mode of operation is available when DECODER.LOAD is set to WaveForm. In this mode, up to three PWM channels can be enabled - OUT[0] to OUT[2]. In RAM, four values are loaded at a time: the first, second and third location are used to load the values, and the fourth RAM location is used to load the COUNTERTOP register. This way one can have up to three PWM channels with a frequency base that changes on a per PWM period basis. This mode of operation is useful for arbitrary wave form generation in applications, such as LED lighting.

The register SEQ[n].REFRESH=N (one per sequence n=0 or 1) will instruct a new RAM stored pulse width value on every (N+1)<sup>th</sup> PWM period. Setting the register to zero will result in a new duty cycle update every PWM period, as long as the minimum PWM period is observed.

Note that registers SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored when DECODER.MODE=NextStep. The next value is loaded upon every received NEXTSTEP task.

SEQ[n].PTR is the pointer used to fetch COMPARE values from RAM. If the SEQ[n].PTR is not pointing to a RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 21 for more information about the different memory regions. After the SEQ[n].PTR is set to the desired RAM location, the SEQ[n].CNT register must be set to the number of 16-bit half words in the sequence. It is important to observe that the Grouped mode requires one half word per group, while the Single mode requires one half word per channel, thus increasing the RAM size occupation. If PWM generation is not running when the SEQSTART[n] task is triggered, the task will load the first value from RAM and then start the PWM generation. A SEQSTARTED[n] event is generated as soon as the EasyDMA has read the first PWM parameter from RAM and the wave counter has started executing it. When LOOP.CNT=0, sequence n=0 or 1 is played back once. After the last value in the sequence has been loaded and started executing, a SEQEND[n] event is generated. The PWM generation will then continue with the last loaded value. The following figure illustrates an example of a simple playback.

Figure 117: Simple sequence example

The following source code is used for configuration and timing details in a sequence where only sequence 0 is used and only run once with a new PWM duty cycle for each period.

```
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER    = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP   = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP         = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER      = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR   = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT   = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;
```

To completely stop the PWM generation and force the associated pins to a defined state, a STOP task can be triggered at any time. A STOPPED event is generated when the PWM generation has stopped at the end of the currently running PWM period, and the pins go into their idle state as defined in GPIO OUT register.

PWM generation can then only be restarted through a SEQSTART[n] task. SEQSTART[n] will resume PWM generation after having loaded the first value from the RAM buffer defined in the SEQ[n].PTR register.

The following table indicates when specific registers get sampled by the hardware. Care should be taken when updating these registers to avoid that values are applied earlier than expected.

| Register        | Taken into account by hardware                                                                                                               | Recommended (safe) update                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| SEQ[n].PTR      | When sending the SEQSTART[n] task                                                                                                            | After having received the SEQSTARTED[n] event                                                |
| SEQ[n].CNT      | When sending the SEQSTART[n] task                                                                                                            | After having received the SEQSTARTED[n] event                                                |
| SEQ[0].ENDDELAY | When sending the SEQSTART[0] task                                                                                                            | Before starting sequence [0] through a SEQSTART[0] task                                      |
|                 | Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | When no more value from sequence [0] gets loaded from RAM (indicated by the SEQEND[0] event) |
|                 |                                                                                                                                              | At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated)     |
| SEQ[1].ENDDELAY | When sending the SEQSTART[1] task                                                                                                            | Before starting sequence [1] through a SEQSTART[1] task                                      |
|                 | Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | When no more value from sequence [1] gets loaded from RAM (indicated by the SEQEND[1] event) |
|                 |                                                                                                                                              | At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated)     |
| SEQ[0].REFRESH  | When sending the SEQSTART[0] task                                                                                                            | Before starting sequence [0] through a SEQSTART[0] task                                      |
|                 | Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated)     |
| SEQ[1].REFRESH  | When sending the SEQSTART[1] task                                                                                                            | Before starting sequence [1] through a SEQSTART[1] task                                      |
|                 | Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event) | At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated)     |
| COUNTERTOP      | In DECODER.LOAD=WaveForm: this register is ignored.                                                                                          | Before starting PWM generation through a SEQSTART[n] task                                    |
|                 | In all other LOAD modes: at the end of current PWM period (indicated by the PWMPERIODEND event)                                              | After a STOP task has been triggered, and the STOPPED event has been received.               |
| MODE            | Immediately                                                                                                                                  | Before starting PWM generation through a SEQSTART[n] task                                    |
|                 |                                                                                                                                              | After a STOP task has been triggered, and the STOPPED event has been received.               |
| DECODER         | Immediately                                                                                                                                  | Before starting PWM generation through a SEQSTART[n] task                                    |
|                 |                                                                                                                                              | After a STOP task has been triggered, and the STOPPED event has been received.               |
| PRESCALER       | Immediately                                                                                                                                  | Before starting PWM generation through a SEQSTART[n] task                                    |
|                 |                                                                                                                                              | After a STOP task has been triggered, and the STOPPED event has been received.               |
| LOOP            | Immediately                                                                                                                                  | Before starting PWM generation through a SEQSTART[n] task                                    |
|                 |                                                                                                                                              | After a STOP task has been triggered, and the STOPPED event has been received.               |
| PSEL.OUT[n]     | Immediately                                                                                                                                  | Before enabling the PWM instance through the ENABLE register                                 |

Table 45: When to safely update PWM registers

**Note:** SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored at the end of a complex sequence, indicated by a LOOPSDONE event. The reason for this is that the last value loaded from RAM is maintained until further action from software (restarting a new sequence, or stopping PWM generation).

The following figure shows a more complex example using the register [LOOP](#) on page 442.

Figure 118: Example using two sequences

In this case, an automated playback takes place, consisting of SEQ[0], delay 0, SEQ[1], delay 1, then again SEQ[0], etc. The user can choose to start a complex playback with SEQ[0] or SEQ[1] through sending the SEQSTART[0] or SEQSTART[1] task. The complex playback always ends with delay 1.

The two sequences 0 and 1 are defined by the addresses of value tables in RAM (pointed to by SEQ[n].PTR) and the buffer size (SEQ[n].CNT). The rate at which a new value is loaded is defined individually for each sequence by SEQ[n].REFRESH. The chaining of sequence 1 following the sequence 0 is implicit, the LOOP.CNT register allows the chaining of sequence 1 to sequence 0 for a determined number of times. In other words, it allows to repeat a complex sequence a number of times in a fully automated way.

In the following code example, sequence 0 is defined with SEQ[0].REFRESH set to 1, meaning that a new PWM duty cycle is pushed every second PWM period. This complex sequence is started with the SEQSTART[0] task, so SEQ[0] is played first. Since SEQ[0].ENDDDELAY=1 there will be one PWM period delay between last period on sequence 0 and the first period on sequence 1. Since SEQ[1].ENDDDELAY=0 there is no delay 1, so SEQ[0] would be started immediately after the end of SEQ[1]. However, as LOOP.CNT is

1, the playback stops after having played SEQ[1] only once, and both SEQEND[1] and LOOPSDONE are generated (their order is not guaranteed in this case).

```

NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->SEQ[0].PTR   = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[0].CNT   = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[0].REFRESH = 1;
NRF_PWM0->SEQ[0].ENDDELAY = 1;
NRF_PWM0->SEQ[1].PTR   = ((uint32_t)(seq1_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT   = ((sizeof(seq1_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_SEQSTART[0] = 1;

```

The decoder can also be configured to asynchronously load new PWM duty cycle. If the DECODER.MODE register is set to NextStep, then the NEXTSTEP task will cause an update of internal compare registers on the next PWM period.

The following figures provide an overview of each part of an arbitrary sequence, in various modes (LOOP.CNT=0 and LOOP.CNT>0). In particular, the following are represented:

- Initial and final duty cycle on the PWM output(s)
- Chaining of SEQ[0] and SEQ[1] if LOOP.CNT>0
- Influence of registers on the sequence
- Events generated during a sequence
- DMA activity (loading of next value and applying it to the output(s))

Figure 119: Single shot ( $LOOP.CNT=0$ )

**Note:** The single-shot example also applies to SEQ[1]. Only SEQ[0] is represented for simplicity.

Figure 120: Complex sequence ( $LOOP.CNT>0$ ) starting with SEQ[0]

Figure 121: Complex sequence ( $LOOP.CNT > 0$ ) starting with  $SEQ[1]$

**Note:** If a sequence is in use in a simple or complex sequence, it must have a length of  $SEQ[n].CNT > 0$ .

This example shows how the PWM module can be configured to repeat a single sequence until stopped.

```
NRF_PWM0->PSEL.OUT[0] = (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                          PWM_PSEL_OUT_CONNECT_Pos);

NRF_PWM0->ENABLE       = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE         = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER    = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                          PWM_PRESCALER_PRESCALER_Pos);

NRF_PWM0->COUNTERTOP   = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
// Enable the shortcut from LOOPSDONE event to SEQSTART1 task for infinite loop
NRF_PWM0->SHORTS       = (PWM_SHORTS_LOOPSDONE_SEQSTART1_Enabled <<
                          PWM_SHORTS_LOOPSDONE_SEQSTART1_Pos);

// LOOP_CNT must be greater than 0 for the LOOPSDONE event to trigger and enable looping
NRF_PWM0->LOOP         = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER      = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);

// To repeat a single sequence until stopped, it must be configured in SEQ[1]
NRF_PWM0->SEQ[1].PTR   = ((uint32_t)(seq0_ram) << PWM_SEQ_PTR_PTR_Pos);
NRF_PWM0->SEQ[1].CNT   = ((sizeof(seq0_ram) / sizeof(uint16_t)) <<
                          PWM_SEQ_CNT_CNT_Pos);

NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDelay = 0;
NRF_PWM0->TASKS_SEQSTART[1] = 1;
```

### 7.23.3 Limitations

The previous compare value is repeated if the PWM period is shorter than the time it takes for the EasyDMA to retrieve from RAM and update the internal compare registers. This is to ensure a glitch-free operation even for very short PWM periods.

Only SEQ[1] can trigger the **LOOPSDONE** event upon completion, not SEQ[0]. This requires looping to be enabled (**LOOP** > 0) and **SEQ[1].CNT** > 0 when sequence playback starts.

### 7.23.4 Pin configuration

The OUT[n] (n=0..3) signals associated with each PWM channel are mapped to physical pins according to the configuration of PSEL.OUT[n] registers. If PSEL.OUT[n].CONNECT is set to Disconnected, the associated PWM module signal will not be connected to any physical pins.

The PSEL.OUT[n] registers and their configurations are used as long as the PWM module is enabled and the PWM generation active (wave counter started). They are retained only as long as the device is in System ON mode (see the **POWER** section for more information about power modes).

To ensure correct behavior in the PWM module, the pins that are used must be configured in the GPIO peripheral in the following way before the PWM module is enabled:

| PWM signal | PWM pin                                 | Direction | Output value | Comment                                 |
|------------|-----------------------------------------|-----------|--------------|-----------------------------------------|
| OUT[n]     | As specified in PSEL.OUT[n]<br>(n=0..3) | Output    | 0            | Idle state defined in GPIO OUT register |

Table 46: Recommended GPIO configuration before starting PWM generation

The idle state of a pin is defined by the OUT register in the GPIO module, to ensure that the pins used by the PWM module are driven correctly. If PWM generation is stopped by triggering a STOP task, the PWM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected pins (I/Os) for as long as the PWM module is supposed to be connected to an external PWM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

### 7.23.5 Registers

#### Instances

| Instance  | Domain      | Base address | TrustZone |     |     | Split access | Description                   |
|-----------|-------------|--------------|-----------|-----|-----|--------------|-------------------------------|
|           |             |              | Map       | Att | DMA |              |                               |
| PWM0 : S  | APPLICATION | 0x50021000   | US        | S   | SA  | No           | Pulse width modulation unit 0 |
| PWM0 : NS |             | 0x40021000   |           |     |     |              |                               |
| PWM1 : S  | APPLICATION | 0x50022000   | US        | S   | SA  | No           | Pulse width modulation unit 1 |
| PWM1 : NS |             | 0x40022000   |           |     |     |              |                               |
| PWM2 : S  | APPLICATION | 0x50023000   | US        | S   | SA  | No           | Pulse width modulation unit 2 |
| PWM2 : NS |             | 0x40023000   |           |     |     |              |                               |

| PWM3 : NS |             | 0x40024000   |           |     |     |              |                               |

## Register overview

| Register              | Offset | TZ | Description                                                                                                                                                                                                  |
|-----------------------|--------|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TASKS_STOP            | 0x004  |    | Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback                                                                                                     |
| TASKS_SEQSTART[n]     | 0x008  |    | Loads the first PWM value on all enabled channels from sequence n, and starts playing that sequence at the rate defined in SEQ[n]REFRESH and/or DECODER.MODE. Causes PWM generation to start if not running. |
| TASKS_NEXTSTEP        | 0x010  |    | Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running.                                                          |
| SUBSCRIBE_STOP        | 0x084  |    | Subscribe configuration for task <a href="#">STOP</a>                                                                                                                                                        |
| SUBSCRIBE_SEQSTART[n] | 0x088  |    | Subscribe configuration for task <a href="#">SEQSTART[n]</a>                                                                                                                                                 |
| SUBSCRIBE_NEXTSTEP    | 0x090  |    | Subscribe configuration for task <a href="#">NEXTSTEP</a>                                                                                                                                                    |
| EVENTS_STOPPED        | 0x104  |    | Response to STOP task, emitted when PWM pulses are no longer generated                                                                                                                                       |
| EVENTS_SEQSTARTED[n]  | 0x108  |    | First PWM period started on sequence n                                                                                                                                                                       |
| EVENTS_SEQEND[n]      | 0x110  |    | Emitted at end of every sequence n, when last value from RAM has been applied to wave counter                                                                                                                |
| EVENTS_PWMPERIODEND   | 0x118  |    | Emitted at the end of each PWM period                                                                                                                                                                        |
| EVENTS_LOOPSDONE      | 0x11C  |    | Concatenated sequences have been played the amount of times defined in LOOP.CNT                                                                                                                              |

### 7.23.5.1 TASKS\_STOP

Address offset: 0x004

Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback

### 7.23.5.11 EVENTS\_LOOPSDONE

Address offset: 0x11C

Concatenated sequences have been played the amount of times defined in LOOP.CNT

This event triggers after the last SEQ[1] completion of the loop, and only if looping was enabled (LOOP > 0) when the sequence playback was started.

Address offset:  $0x528 + (n \times 0x20)$

Number of additional PWM periods between samples loaded into compare register

|            |  |  |  |  |  ## 7.24 QDEC — Quadrature decoder

The Quadrature decoder (QDEC) provides buffered decoding of quadrature-encoded sensor signals. It is suitable for mechanical and optical sensors.

The sample period and accumulation are configurable to match application requirements. The QDEC provides the following:

- Decoding of digital waveform from off-chip quadrature encoder.
- Sample accumulation eliminating hard real-time requirements to be enforced on application.
- Optional input de-bounce filters.
- Optional LED output signal for optical encoders.

Figure 122: Quadrature decoder configuration

### 7.24.1 Sampling and decoding

The QDEC decodes the output from an incremental motion encoder by sampling the QDEC phase input pins (A and B).

The off-chip quadrature encoder is an incremental motion encoder outputting two waveforms, phase A and phase B. The two output waveforms are always 90 degrees out of phase, meaning that one always changes level before the other. The direction of movement is indicated by the waveform that changes level first. Invalid transitions may occur, meaning the two waveforms simultaneously switch. This may occur if the wheel rotates too fast relative to the sample rate set for the decoder.

The QDEC decodes the output from the off-chip encoder by sampling the QDEC phase input pins (A and B) at a fixed rate as specified in the SAMPLEPER register.

If the SAMPLEPER value needs to be changed, the QDEC shall be stopped using the STOP task. SAMPLEPER can be then changed upon receiving the STOPPED event, and QDEC can be restarted using the START task. Failing to do so may result in unpredictable behavior.

It is good practice to only change registers LEDPOL, REPORTPER, DBFEN, and LEDPRE when the QDEC is stopped.

When started, the decoder continuously samples the two input waveforms and decodes these by comparing the current sample pair (n) with the previous sample pair (n-1).

The decoding of the sample pairs is described in the table below.

| Previous sample pair(n - 1) |   | Current samples pair(n) |   | SAMPLE register | ACC operation | ACCDBL operation | Description                    |
|-----------------------------|---|-------------------------|---|-----------------|---------------|------------------|--------------------------------|
| A                           | B | A                       | B |                 |               |                  |                                |
| 0                           | 0 | 0                       | 0 | 0               | No change     | No change        | No movement                    |
| 0                           | 0 | 0                       | 1 | 1               | Increment     | No change        | Movement in positive direction |
| 0                           | 0 | 1                       | 0 | -1              | Decrement     | No change        | Movement in negative direction |

Table 47: Sampled value encoding

## 7.24.2 LED output

The LED output follows the sample period. The LED is switched on for a set period before sampling and then switched off immediately after. The period the LED is switched on before sampling is given in the LEDPRE register.

The LED output pin polarity is specified in the LEDPOL register.

When using off-chip mechanical encoders not requiring an LED, the LED output can be disabled by writing value 'Disconnected' to the CONNECT field of the PSEL.LED register. In this case, the QDEC will not acquire access to a pin for the LED output.

## 7.24.3 Debounce filters

Each of the two-phase inputs have digital debounce filters.

When enabled through the DBFEN register, the filter inputs are sampled at a fixed 1 MHz frequency during the entire sample period (which is specified in the SAMPLEPER register). The filters require all of the samples within this sample period to equal before the input signal is accepted and transferred to the output of the filter.

As a result, only input signal with a steady state longer than twice the period specified in SAMPLEPER are guaranteed to pass through the filter. Any signal with a steady state shorter than SAMPLEPER will always be suppressed by the filter. It is assumed that the frequency during the debounce period never exceeds 500 kHz (as required by the Nyquist theorem when using a 1 MHz sample frequency).

The LED will always be ON when the debounce filters are enabled, as the inputs in this case will be sampled continuously.

When the debounce filters are enabled, displacements reported by the QDEC peripheral are delayed by one SAMPLEPER period.

## 7.24.4 Accumulators

The quadrature decoder contains two accumulator registers, ACC and ACCDBL. These registers accumulate valid motion sample values and the number of detected invalid samples (double transitions), respectively.

The ACC register accumulates all valid values (1/-1) written to the SAMPLE register. This can be useful for preventing hard real-time requirements from being enforced on the application. When using the ACC register, the application can fetch data when necessary instead of reading all SAMPLE register output. The ACC register holds the relative movement of the external mechanical device from the previous clearing of the ACC register. Sample values indicating a double transition (2) will not be accumulated in the ACC register.

An ACCOF event is generated if the ACC receives a SAMPLE value that would cause the register to overflow or underflow. Any SAMPLE value that would cause an ACC overflow or underflow will be discarded, but any samples that do not cause the ACC to overflow or underflow will still be accepted.

The accumulator ACCDBL accumulates the number of detected double transitions since the previous clearing of the ACCDBL register.

The ACC and ACCDBL registers can be cleared by the READCLRACC and subsequently read using the ACCREAD and ACCDBLREAD registers.

The ACC register can be separately cleared by the RDCLRACC and subsequently read using the ACCREAD registers.

The ACCDBL register can be separately cleared by the RDCLRDBL and subsequently read using the ACCDBLREAD registers.

The REPORTPER register allows automated capture of multiple samples before sending an event. When a non-null displacement is captured and accumulated, a REPORTRDY event is sent. When one or more double-displacements are captured and accumulated, a DBLRDY event is sent. The REPORTPER field in this register determines how many samples must be accumulated before the contents are evaluated and a REPORTRDY or DBLRDY event is sent.

Using the RDCLRACC task (manually sent upon receiving the event, or using the DBLRDY\_RDCLRACC shortcut), ACCREAD can then be read.

When a double transition has been captured and accumulated, a DBLRDY event is sent. Using the RDCLRDBL task (manually sent upon receiving the event, or using the DBLRDY\_RDCLRDBL shortcut), ACCDBLREAD can then be read.

## 7.24.5 Output/input pins

The QDEC uses a three-pin interface to the off-chip quadrature encoder.

These pins are acquired when the QDEC is enabled in the ENABLE register. The pins acquired by the QDEC cannot be written by the CPU, but they can still be read by the CPU.

The pin numbers used for the QDEC are selected using the PSEL.n registers.

## 7.24.6 Pin configuration

The Phase A, Phase B, and LED signals are mapped to physical pins according to the configuration specified in the PSEL.A, PSEL.B, and PSEL.LED registers respectively.

If the CONNECT field value 'Disconnected' is specified in any of these registers, the associated signal will not be connected to any physical pin. The PSEL.A, PSEL.B, and PSEL.LED registers and their configurations are only used as long as the QDEC is enabled, and retained only as long as the device is in ON mode. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN\_CNF[n] register.

To secure correct behavior in the QDEC, the pins used by the QDEC must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 447 before enabling the QDEC. This configuration must be retained in the GPIO for the selected I/Os as long as the QDEC is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

| QDEC signal | QDEC pin                 | Direction | Output value   | Comment |
|-------------|--------------------------|-----------|----------------|---------|
| Phase A     | As specified in PSEL.A   | Input     | Not applicable |         |
| Phase B     | As specified in PSEL.B   | Input     | Not applicable |         |
| LED         | As specified in PSEL.LED | Input     | Not applicable |         |

Table 48: GPIO configuration before enabling peripheral

### 7.24.7.3 TASKS\_READCLRACC

Address offset: 0x008

Read and clear ACC and ACCDL

Task transferring the content of ACC to ACCREAD and the content of ACCDL to ACCDLREAD, and then clearing the ACC and ACCDL registers. These read-and-clear operations will be done atomically.

### 7.24.7.12 EVENTS\_REPORTRDY

Address offset: 0x104

Non-null report ready

Event generated when REPORTPER number of samples has been accumulated in the ACC register and the content of the ACC register is not equal to 0. (Thus, this event is only generated if a motion is detected since the previous clearing of the ACC register).

 | A                | R   | ACC   |          | [-1024..1023] |    |    |    | Register accumulating all valid samples (not double transition) read from the SAMPLE register.<br><br>Double transitions ( SAMPLE = 2 ) will not be accumulated in this register.<br>The value is a 32 bit 2's complement value. If a sample that would cause this register to overflow or underflow is received, the sample will be ignored and an overflow event ( ACCOF ) will be generated. The ACC register is cleared by triggering the READCLRACC or the RDCLRACC task. |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

## 7.25 QSPI — Quad serial peripheral interface

The QSPI peripheral provides support for communicating with an external flash memory device using SPI.

The main features for the QSPI peripheral are:

- Single/dual/quad SPI input/output
- 6 to 96 MHz configurable clock frequency
- Single-word read/write access from/to external flash
- EasyDMA for block read and write transfers
- Up to 48 MB/sec EasyDMA read rate
- Execute in place (XIP) for executing program directly from external flash
- XIP access can optionally be disabled
- On-the-fly encryption and decryption, including EasyDMA and XIP

Figure 123: Block diagram

### 7.25.1 Configuring QSPI

Before any data can be transferred to or from the external flash memory, the peripheral needs to be configured.

1. Select the mandatory input/output pins in the following registers:

- [PSEL.SCK](#) on page 481
- [PSEL.CSN](#) on page 482
- [PSEL.IO0](#) on page 482
- [PSEL.IO1](#) on page 482
- [PSEL.IO2](#) on page 483
- [PSEL.IO3](#) on page 483

For which pins to use, see [Pin assignments](#) on page 851. Only the dedicated QSPI pins shall be used.

2. To ensure stable operation, set the GPIO drive strength to high drive. See the [GPIO — General purpose input/output](#) on page 293 chapter for details on how to configure GPIO drive strength.
3. Activate the dedicated peripheral setting of the GPIO pin. See the [GPIO — General purpose input/output](#) on page 293 chapter for details on how to assign pins between cores, peripherals, or subsystems.
4. Configure the interface towards the external flash memory using [IFCONFIG0](#) on page 484, [IFCONFIG1](#) on page 488, and [ADDRCONF](#) on page 490.
5. Enable the QSPI peripheral and acquire I/O pins using [ENABLE](#) on page 479.
6. Activate the external flash memory interface using the ACTIVATE task. The READY event will be generated when the interface has been activated and the external flash memory is ready for access.

**Note:**

If the `IFCONFIG0` register is configured to use the quad mode, the external flash device also needs to be set in the quad mode before any data transfers can take place.

This can be done by sending custom instructions to the external flash device, as described in [Sending custom instructions](#) on page 465.

## 7.25.2 Write operation

A write operation to the external flash is configured using the `WRITE.DST`, `WRITE.SRC`, and `WRITE.CNT` registers. It is started using the `WRITESTART` task.

The READY event is generated when the transfer is complete.

The QSPI peripheral automatically takes care of splitting DMA transfers into page writes.

## 7.25.3 Read operation

A read operation from the external flash is configured using the `READ.SRC`, `READ.DST`, and `READ.CNT` registers. It is started using the `READSTART` task.

The READY event is generated when the transfer is complete.

## 7.25.4 Erase operation

Erase of pages/blocks of the external flash is configured using the `ERASE.PTR` and `ERASE.LEN` registers. It is started using the `ERASESTART` task.

The READY event is generated when the erase operation has been started.

In this case, the READY event will not indicate that the erase operation of the flash has been completed, but it only signals that the erase operation has been started. The actual status of the erase operation can normally be read from the external flash using a custom instruction (see [Sending custom instructions](#) on page 465).

## 7.25.5 Execute in place

Execute in place (XIP) allows the CPU to execute program code directly from the external flash.

After the external flash has been configured, the CPU can execute code from the external flash by accessing the XIP memory region. See the following figure and [Memory](#) on page 21 for details.

The XIP memory region is read-only, writing to it will result in a bus error.

When accessing the XIP memory region, the start address of this XIP memory region will map to the address `XIPOFFSET` on page 483 of the external flash.

Figure 124: XIP memory map

### 7.25.6 Encryption

The contents of an external flash memory can be protected using stream cipher encryption. Encryption can be configured and enabled independently for XIP and EasyDMA, with separate keys and nonce.

Once configured and enabled, the stream cipher operates between the AHB bus and the external flash, encrypting and decrypting data passing through.

The following figure shows the stream cipher block with the three configuration registers. The stream cipher uses an AES 128 encryption operation to form the keystream from key, nonce, and external memory address. The keystream then combines each 32-bit plaintext digit one at a time with the corresponding digit of the keystream.

Figure 125: Stream cipher

The same nonce and key must be used for both encryption and decryption of the same memory address.

The memory address used for encryption is the external flash memory address and thus independent of [XIPOFFSET](#) on page 483. This means a second firmware image can be encrypted and written using EasyDMA, then [XIPOFFSET](#) on page 483 set to point to the new firmware image before executing from it.

Stream ciphers are symmetric. They do not differentiate between encrypting or decrypting, reading or writing. Thus, if the contents of a plain text external flash is read when stream cipher is enabled, the data provided to the MCU is encrypted.

## Execute in place (XIP)

Enable the stream cipher for QSPI XIP by doing the following steps.

1. Configure keys using [XIP\\_ENC.KEY0](#) on page 485 through [XIP\\_ENC.KEY3](#) on page 485.
2. Configure nonce using [XIP\\_ENC.NONCE0](#) on page 485 through [XIP\\_ENC.NONCE2](#) on page 486.
3. Set [XIP\\_ENC.ENABLE](#) on page 486.

Any instructions or data read from the XIP interface will now pass through the stream cipher.

## EasyDMA

Enable the stream cipher for QSPI EasyDMA by doing the following steps.

1. Configure keys using [DMA\\_ENC.KEY0](#) on page 486 through [DMA\\_ENC.KEY3](#) on page 487.
2. Configure nonce using [DMA\\_ENC.NONCE0](#) on page 487 through [DMA\\_ENC.NONCE2](#) on page 488.
3. Set [DMA\\_ENC.ENABLE](#) on page 488.

Any data read from or written to the external flash over the EasyDMA interface will now pass through the stream cipher.

## 7.25.7 Sending custom instructions

Custom instructions can be sent to the external flash using the [CINSTRCONF](#), [CINSTRDAT0](#), and [CINSTRDAT1](#) registers. It is possible to send an instruction consisting of a one-byte opcode and up to 8 bytes of additional data and to read its response.

A custom instruction is prepared by first writing the data to be sent to [CINSTRDAT0](#) and [CINSTRDAT1](#) before writing the opcode and other configurations to the [CINSTRCONF](#) register.

The custom instruction is sent when the [CINSTRCONF](#) register is written and it is always sent on a single data line SPI interface.

The READY event will be generated when the custom instruction has been sent.

After a custom instruction has been sent, the [CINSTRDAT0](#) and [CINSTRDAT1](#) will contain the response bytes from the custom instruction.

The data of custom instructions is not part of the stream cipher encryption.

Optional

Figure 126: Sending custom instruction

### 7.25.7.1 Long frame mode

The LFEN and LFSTOP fields in the [CINSTRCONF](#) register control the operation of the custom instruction Long frame mode. Long frame mode is a mechanism that permits arbitrary byte length custom instructions. While in Long frame mode a long custom instruction sequence is split in multiple writes to the [CINSTRDAT0](#) and [CINSTRDAT1](#) registers.

To enable Long frame mode every write to the [CINSTRCONF](#) register must have the LFEN field set to 1. The contents of the OP\_CODE field will be transmitted after the first write to [CINSTRCONF](#) and will be omitted in every subsequent write to this register. For subsequent writes the number of data bytes as specified in the LENGTH field are transferred (that is the value of LENGTH - 1 data bytes). The values of the LIO2 and LIO3 fields are set in the first write to [CINSTRCONF](#) and will apply for the entire custom instruction transmission until the long frame is finalized.

To finalize a long frame transmission, the LFSTOP field in the [CINSTRCONF](#) register must be set to 1 in the last write to this register.

### 7.25.8 Deep power-down mode

The external flash memory can be put in Deep power-down mode (DPM) to minimize its current consumption when there is no need to access the memory.

DPM is enabled in register [IFCONFIG0](#) on page 484 and configured in register [DPM DUR](#) on page 489. The DPM status of the external memory can be read in the [STATUS](#) register. The [DPM DUR](#) register has to be configured according to the external flash specification to get the information in the [STATUS](#) register and the timing of the READY event correct.

Entering or exiting DPM is controlled using register [IFCONFIG1](#) on page 488.

### 7.25.9 Instruction set

The following table shows the instruction set supported by QSPI when communicating with an external flash device.

| Instruction | Opcode                                             | Description                    |
|-------------|----------------------------------------------------|--------------------------------|
| WREN        | 0x06                                               | Write enable                   |
| RDSR        | 0x05                                               | Read status register           |
| WRSR        | 0x01                                               | Write status register          |
| FASTREAD    | 0x0B                                               | Read bytes at higher speed     |
| READ2O      | 0x3B                                               | Dual-read output               |
| READ2IO     | 0xBB                                               | Dual-read input/output         |
| READ4O      | 0x6B                                               | Quad-read output               |
| READ4IO     | 0xEB                                               | Quad-read input/output         |
| PP          | 0x02                                               | Page program                   |
| PP2O        | 0xA2                                               | Dual-page program output       |
| PP4O        | 0x32                                               | Quad-page program output       |
| PP4IO       | 0x38                                               | Quad-page program input/output |
| SE          | 0x20                                               | Sector erase                   |
| BE          | 0xD8                                               | Block erase                    |
| CE          | 0xC7                                               | Chip erase                     |
| DP          | 0xB9                                               | Enter Deep power-down mode     |
| DPE         | 0xAB                                               | Exit Deep power-down mode      |
| EN4B        | Specified in the <a href="#">ADDRCONF</a> register | Enable 32 bit address mode     |

The timing diagram illustrates the 1-Wire protocol sequence. It shows the relationship between the Serial Clock (SCK), Chip Select (CSN), and I/O signals (IO0, IO1, IO2, IO3). The SCK signal is a periodic clock. The CSN signal is active-low, transitioning from high to low at the start of the command phase and back to high at the end of the data phase. The IO0 signal is used for data transfer, with bits 31-28 for the address and bits 7-0 for the data. The IO1, IO2, and IO3 signals are shown as Hi-Z (high impedance) during the data phase. The data is transferred in three 8-bit segments, labeled 1, 2, and 3, corresponding to the three data bytes. The command phase is labeled 'Command - 02h' and the address phase is labeled '32-bit address'.

The diagram illustrates the timing for a 32-bit read operation. The signals shown are SCK (Serial Clock), CSN (Chip Select, active-low), IO0 (Command/Address), IO1 (Data), IO2, and IO3. The operation is divided into two 16-bit segments. The first segment is labeled "Data out" and the second segment is labeled "Data in".

**Signal Details:**

- SCK:** A clock signal with 32 periods. The first 16 periods correspond to the first 16-bit segment, and the next 16 periods correspond to the second 16-bit segment.
- CSN:** Active-low signal that goes low at the start of the operation and returns high after the second 16-bit segment.
- IO0:** Command (A2h) for the first 16-bit segment and address (31-28) for the second 16-bit segment.
- IO1:** Data bus. The first 16 bits are "Data out" and the next 16 bits are "Data in".
- IO2 and IO3:** Not used in this operation.

**Data Flow:**

- First 16-bit segment (Data out):** The data is split into two 8-bit segments. The first 8 bits are 0, 1, 2, 3, 4, 5, 6, 7. The next 8 bits are 0, 1, 2, 3, 4, 5, 6, 7.
- Second 16-bit segment (Data in):** The data is split into two 8-bit segments. The first 8 bits are 0, 1, 2, 3, 4, 5, 6, 7. The next 8 bits are 0, 1, 2, 3, 4, 5, 6, 7.

### 7.25.11.1 TASKS\_ACTIVATE

Address offset: 0x000

Activate QSPI interface

Triggering this task activates the external flash memory interface and initiates communication with the external memory. The READY event is generated when the activation has been completed.

### 7.25.11.5 TASKS\_DEACTIVATE

Address offset: 0x010

Deactivate QSPI interface

This task might be needed to optimize current consumption in case there are any added current consumption when QSPI interface is activated, but idle.

### 7.25.11.6 SUBSCRIBE\_ACTIVATE

Address offset: 0x080

Subscribe configuration for task [ACTIVATE](#)

Triggering this task activates the external flash memory interface and initiates communication with the external memory. The READY event is generated when the activation has been completed.
